Alternatives Analysis Report

June 2016

June 1, 2016

Mr.Greg Fabun Flood Protection Manager City of West Sacramento 1110 West Capitol Avenue, 2nd Floor West Sacramento, California 95691

Dear Mr. Fabun,

<u>Subject: City of West Sacramento – Flood Program Services – Final Alternatives</u> <u>Analysis Report</u>

Enclosed is the Alternatives Analysis Report that was prepared by Wood Rodgers, Inc. for the subject project. Comments from the City of West Sacramento and the Independent Panel of Experts on the draft version of this report (dated March 2016) have been incorporated as appropriate. A comment and response register is included as Attachment D of the enclosed Alternatives Analysis Report.

If you have any questions regarding the report, please call Jonathan Kors at 916-326-5264 or Jesse Patchett at 916-341-7712.

Sincerely,

Jonathan L. Kors, P.E. Principal in Charge

Jesse J. Patchett, P.E., CFM Project Manager

I. INTRODUCTION

The City of West Sacramento (City) and the West Sacramento Area Flood Control Agency (WSAFCA) are in the process of advancing the West Sacramento Levee Improvement Program (WSLIP). The WSLIP is a comprehensive flood risk reduction program with the goal of providing the City with a minimum of 200-year flood protection. A 200-year flood is a flood that has a 1-in-200 (0.5%) chance of occurring in any given year.

As shown on **Figure 1** (attached), the City is protected on the west by levees along the Yolo Bypass, on the north by levees along the Sacramento Bypass, on the east by levees along the Sacramento River, and on the south by the South Cross Levee. The City is also bifurcated by the Sacramento River Deep Water Ship Channel (DWSC) and Barge Canal, which have levees and areas of high ground on both sides.

In 2007, several bills were passed that amended the California Water Code and Government Code to improve flood protection and align land use decisions with statewide flood planning objectives. Senate Bill 5 (2007), as amended by Senate Bill 1278 (2012) and Assembly Bill 1259 (2013), requires cities and counties within the Sacramento and San Joaquin Valleys to make findings before allowing development in flood hazard zones (DWR, 2010; DWR, 2013; DWR, 2014b). "Flood hazard zones" include floodplains within a Federal Emergency Management Agency (FEMA) designated special flood hazard area (a 100-year floodplain) or a FEMA-designated moderate flood hazard area (a 500-year floodplain) (GC §65007(d)).

To support the advancement of the WSLIP, Wood Rodgers, Inc. (Wood Rodgers) prepared a Problem Identification Report (PIR) for the City and WSAFCA in June 2016 (Wood Rodgers' 2016 PIR) outlining, at a high level, the deficiencies remaining to be addressed to support 200-year protection.

This Alternatives Analysis Report (AAR) is a follow-on document that identifies alternatives and estimated costs for mitigating the deficiencies identified in the PIR. Both the Wood Rodgers' 2016 PIR and this AAR will be referenced by the City of West Sacramento Adequate Progress Report that is currently being prepared to meet the requirements of Senate Bill 5 in July of 2016.

II. SUMMARY OF IDENTIFIED SYSTEM DEFICIENCIES

Wood Rodgers' 2016 PIR identified seepage, stability, freeboard, geometry, erosion, vegetation, and encroachment/penetration deficiencies in many of the levees that protect the City. The only areas that did not have significant deficiencies were those areas where WSLIP Early Implementation Projects (EIPs) and levee improvements performed by the USACE have been constructed. A graphical depiction of the overall deficiencies identified in Wood Rodgers' 2016 PIR is shown on **Figure 2** (attached). Tabular results of identified deficiencies are included in **Table 1** (attached). Brief descriptions of the deficiencies identified for each levee segment are

included below. The geotechnical deficiencies considered existing conditions and did not consider future improvements such as levee raises for freeboard deficiencies. The geotechnical deficiencies further assumed that any landside development would require additional analysis to determine potential impacts to the levee system as well as to the proposed development.

A. Sacramento River West North Levee

In general, the Sacramento River West North Levee evaluation indicates that there is a potential for through seepage north (upstream) of Station 136+00. The exception is between Stations 71+50 and 101+00, where The Rivers EIP Project addressed known issues. Due to the relatively wide levee in this area, it is possible that the concern for identified through seepage issues upstream of Station 136+00 may be eliminated with additional monitoring and reporting during high water events. The freeboard and geometry issues in this reach are generally intermittent and minor (between six and eight inches). Erosion was identified as a concern from Stations 0+00 to 43+00 in this segment.

Between Stations 136+00 and 215+30, through seepage, steady-state underseepage and landside slope stability, and waterside rapid drawdown slope stability deficiencies were identified. The freeboard and geometry issues in this segment are generally intermittent and minor (between six and eight inches). Erosion was identified as a concern in this segment for the area located between Stations 161+00 and 215+30. Additional analysis may confirm that recent improvements between Stations 194+60 and 199+60 for the I Street Bridge EIP project sufficiently addressed the identified geotechnical deficiencies.

Neither through seepage issues nor underseepage issues were identified downstream of the Tower Bridge (i.e.: Station 215+30) due primarily to the levee measuring several hundred feet in width. This segment does contain areas with relatively steep waterside slopes which would traditionally result in waterside slope instabilities. Waterside slopes steeper than 2H:1V exist within several portions of this levee segment. For levee segments considered high ground and/or wide levees, identification of a waterside rapid drawdown slope stability deficiency is dependent on the location of the assumed theoretical levee template. For example, if the waterside slope levee template is located within approximately five feet of the existing waterside slope, a rapid drawdown slope stability deficiency would be identified and the slopes would require slope flattening. If the template is located further inland, Blackburn Consulting (BCI) would recommend that the waterslide slopes be maintained during and after high water events to maintain the existing waterside slope location.

Therefore, two alternatives to address waterside instability could be considered within these levee stretches where waterside slopes are steeper than 2H:1V. The first alternative would be to flatten the waterside slopes to 2H:1V, removing the instability. The second

alternative would be to consider the risk to existing infrastructure due to the potential slope failure. Where infrastructure or existing improvements are not likely to be impacted by a slope failure, the waterside instabilities can be considered a maintenance issue to be repaired by the Local Maintaining Agency if a failure occurs. This AAR assumes that the slopes will be flattened as needed to address the instability as a capital improvement. Future iterations of the AAR may reconsider this approach and defer them to long-term maintenance items.

Freeboard deficiencies downstream of the Tower Bridge generally measure between eight and fourteen inches. Erosion was identified as a concern in this segment between Stations 215+30 and 301+57. Even though this area is considered high-ground, erosion is a concern since prolonged scour along the toe will ultimately result in steeper slopes and landward retreat, threatening existing infrastructure and structures.

In addition to these deficiencies, routine inspections conducted by the California Department of Water Resources (DWR) and the US Army Corps of Engineers (USACE) identified issues with vegetation, encroachments, and penetrations. A total of 78 high-hazard encroachments, 27 high-hazard penetrations, and 26 unacceptable vegetation issues were identified within the Sacramento River West North Levee. Reference is made to Wood Rodgers' 2016 PIR for an explanation of how the hazard assessment ratings for penetrations and encroachments were developed. These issues will need to be addressed as part of the Flood Program since they are believed to pose an unacceptable threat to levee integrity, maintenance, and/or flood-fighting operations. Low and moderate hazard encroachments and penetrations will also be reviewed against potential remediation measures in each reach in order to determine which penetrations and encroachments are most likely to be modified or removed as part of a future remediation project (i.e.: cutoff wall), and which ones can be addressed as part of a long-term remediation plan.

B. Barge Canal Bulkhead Closure Structure

The bulkhead structure (Bulkhead) at the east end of the W.G. Stone Lock is another component of the City's flood protection system. The Bulkhead separates the Sacramento River from the Deep Water Ship Channel (DWSC) and, in a flood event, prevents flood waters in the Sacramento River from entering the DWSC. These facilities were constructed by USACE in conjunction with the construction of the DWSC. In 2006 these facilities were congressionally de-authorized and the responsibility for them was turned over to the City of West Sacramento. Unfortunately, the facilities that are needed to operate and maintain the removable bulkhead structure are not currently operational. A failure at the Bulkhead could cause severe flooding in the Port of West Sacramento and in the City since the water surface elevation in the Sacramento River is approximately 17 feet higher than it is in the DWSC.

The Bulkhead structure has more than three feet of freeboard above the 200-year flood event. However, the concrete abutments and land beyond the abutments only provide approximately 2.5 to 3.0 feet of freeboard. Therefore, minor freeboard improvements are needed at the abutments and adjacent lands.

The assessment also indicated that the Bulkhead is not structurally capable of withstanding the height of water in the Sacramento River during a 200-year flood event. The assessment indicates that the Bulkhead is only capable of withstanding about 13 feet of water differential, whereas a 200-year flood event is expected to create more than a 17-foot differential. In order to make the Bulkhead structurally capable of providing 200-year protection, the Bulkhead would need to be retrofitted by welding steel plates across the Sacramento River and Deep Water Ship Channel sides of each of the twelve plate girder assemblies that make up the Bulkhead. The concrete abutments were determined to be capable of supporting the Bulkhead during a 200-year flood event.

In addition, it was determined that the Bulkhead is not currently seated properly due to debris at the base of the Bulkhead. The sediment and debris prevented large segments of the base of the Bulkhead from being observed, so the condition of the base of the Bulkhead is not known. It is assumed that, if the sediment and debris were removed, water flowing under the Bulkhead would be significantly reduced.

C. Sacramento River West South Levee

The Sacramento River West South Levee has identified deficiencies with underseepage, slope stability, and geometry from Station 0+00 to Station 295+00. From Station 295+00 to Station 332+70, recent levee improvements constructed as part of the USACE, Sacramento River Bank Protection Project, Sacramento River Erosion Repair Site River Mile (RM) 57.2 remediated previously identified deficiencies. There are intermittent, localized areas where freeboard is also insufficient. The Southport EIP Project, which is slated to begin construction in 2016/2017, proposes to address identified underseepage and slope stability deficiencies between Stations 0+00 and 295+00. Therefore, once this project is complete, the only remaining deficiencies will be intermittent freeboard deficiencies between Stations 315+00 and 332+70. The freeboard deficiency is generally less than six inches.

In addition to these deficiencies, routine inspections conducted by DWR and USACE indicate that there are issues with vegetation, encroachments, and penetrations. Only issues between Stations 295+00 and 332+70 are shown since penetrations, encroachments, and vegetation issues between Stations 0+00 and 295+00 will be addressed with the Southport EIP project.

Upstream of Station 295+00, the Sacramento River West South Levee is generally in good condition. Only one high-hazard encroachment was identified between Stations 295+00 and 332+70. This was identified as a pair of wooden posts and a highway marker on the landside slope. The USACE inspections also indicate that there are issues with trees along the waterside slope between Stations 315+00 and 332+70. These items will need to be addressed as part of the Flood Program.

D. Sacramento Bypass South Levee

USACE Levee Reconstruction Contract B and the recent California Highway Patrol (CHP) Academy EIP project addressed many of the historical deficiencies related to through seepage, underseepage, slope stability and erosion. The results of this evaluation indicate that the Sacramento Bypass South Levee mostly meets seepage, stability, freeboard, and erosion criteria. The only remaining deficiencies include a through and/or underseepage issue in the easternmost 285 feet of the levee (i.e.: Station 61+75 to Station 64+60) since the CHP EIP construction did not extend into this levee segment. A geometry deficiency was also identified throughout this levee since a theoretical Urban Levee Design Criteria (ULDC) bypass levee prism with 4H:1V waterside and 3H:1V landside slopes does not fit within the existing embankment. However, although a ULDC geometry deficiency was identified in this reach, it is assumed that this segment will qualify for an exception from the geometry requirements specified in Title 23 § 120.a.25 because the USACE, Central Valley Flood Protection Board (CVFPB), and DWR provided their concurrence with the CHP Academy EIP Project design. This project also included an Independent External Peer Review, also known as a Safety Assurance Review.

In addition to these deficiencies, routine inspections conducted by DWR and USACE revealed issues with vegetation, encroachments, and penetrations. A total of two high-hazard encroachments (unpermitted monitoring wells) and three high-hazard penetrations (fiber optic line, drainage pipe, and unknown 4-inch-diameter pipe) were identified in this levee. The USACE inspections also found four vegetation issues along the landside and waterside slopes. These high-hazard encroachments and penetrations will also be reviewed against potential remediation measures in each reach in order to determine which penetrations and encroachments are likely to be modified or removed as part of a future remediation project (i.e.: cutoff wall), and which ones can be addressed as part of a long-term remediation plan.

E. Training Berm

The Training Berm directs water from the Sacramento Bypass into the main channel of the Yolo Bypass. When the Sacramento and Yolo Bypasses flood, water exists on both sides

of this berm and, therefore, there is no seepage gradient. However, the berm appears to be important for hydraulic reasons, and determining its susceptibility to erosion is important. The results of Wood Rodgers' 2016 PIR indicated that slope stability and erosion are concerns for this entire berm segment. Penetrations, encroachments, and vegetation issues were not identified in this berm.

F. Yolo Bypass East Levee

Between the Port North Levee and Interstate 80 (I-80), the evaluation of the Yolo Bypass East Levee identified relatively few geotechnical deficiencies. Steady-state underseepage and landside slope stability deficiencies were identified between Stations 27+52 and 51+63, and waterside slope stability concerns were generally identified between Stations 51+63 and 70+00.

The levee segment between I-80 and the Union Pacific Railroad (UPRR) crossing (Stations 82+82 to 136+00) has had numerous slope stability failures since completion of the USACE West Sacramento Project Contract A Improvements in 1998. Therefore, landside and waterside slope instability was identified as the primary geotechnical concern in this segment. An underseepage issue was also identified immediately north of the UPRR crossing. This deficiency exists because the existing ditch adjacent to the landside levee toe cannot reasonably be expected to contain water during high water stages in the Yolo Bypass.

Because it is a bypass levee, the Yolo Bypass East Levee was originally designed to have six feet of freeboard on its design water surface (i.e.: the 1957 profile). A wind/wave evaluation performed as part of the General Re-evaluation Report (GRR) indicated that wave runup heights along this levee can be as high as 11 feet, although the risk of landside slope erosion due to overtopping was found to be low in the *Wave Runup and Erosion Analysis for the West Sacramento Levee System General Reevaluation Report* conducted by Northwest Hydraulic Consultants in March 2012 (Reference 14). The GRR also found that placement of waterside rock slope protection (RSP) would address waterside erosion issues and reduce wave runup to less than six feet. Six feet of freeboard is also considered sufficient in the ULDC, except in unusual circumstances. Therefore, six feet of freeboard was determined to be the appropriate threshold criteria for the freeboard evaluation. The entire Yolo Bypass East Levee has less than six feet of freeboard; therefore, a freeboard deficiency was identified for the segment.

The Wood Rodgers Draft 2016 PIR also noted that the Yolo Bypass East Levee does not meet the geometry requirements specified in the ULDC because the waterside slope is steeper than 4H:1V (slopes are generally 2.75H:1V to 3H:1V). Correcting geometry issues along the Yolo Bypass East Levee would require a significant amount of additional

right-of-way on the landside of the levee (through industrial portions of West Sacramento, including existing drainage infrastructure) which may not be practical. For these reasons, where the slopes are otherwise stable, it is assumed that an exception could be obtained from the CVFPB to allow the existing Yolo Bypass East Levee geometry to remain. Erosion deficiencies were intermittently identified for the entire Yolo Bypass East Levee.

In addition to these deficiencies, routine inspections conducted by DWR and USACE indicate that there are issues with vegetation, encroachments, and penetrations. A total of seven high-hazard encroachments and sixteen high-hazard penetrations were identified in this levee. The USACE inspections also indicate that there are issues with trees along the landside and waterside levee slopes. These high-hazard items will need to be addressed as part of the Flood Program since they are believed to pose an unacceptable threat to levee integrity, maintenance, and/or flood fight operations. Low and moderate hazard encroachments and penetrations will also be reviewed against potential remediation measures in each reach in order to determine which penetrations and encroachments are likely to be modified or removed as part of a future remediation project (i.e.: cutoff wall), and which ones can be addressed as part of a long-term remediation plan.

G. South Cross Levee

The South Cross Levee is a dryland levee across the southern end of the City. This levee is only expected to provide flood protection to the City in the event of a failure of the Sacramento River West South Levee or the DWSC East Levee downstream of the South Cross Levee. Underseepage, landside slope stability, geometry, and freeboard deficiencies were found throughout the South Cross Levee. The average freeboard deficiency was approximately 4.5 feet based on a breach of the Sacramento River West South Levee just south of the South Cross Levee during a 200-year storm event.

In addition to these deficiencies, routine inspections conducted by DWR and USACE indicate that there are issues with vegetation, encroachments, and penetrations. A total of four high-hazard penetrations were identified in this levee. The USACE inspections revealed issues with approximately 57 vegetation items along this levee. These items will need to be addressed as part of the Flood Program. Low and moderate hazard encroachments and penetrations will also be reviewed against potential remediation measures in each reach in order to determine which penetrations and encroachments are likely to be modified or removed as part of a future remediation project (i.e.: cutoff wall), and which ones can be addressed as part of a long-term remediation plan.

H. DWSC West Levee

The DWSC West Levee (a.k.a. Navigation Levee) serves as the east levee of the Yolo Bypass. As described in the Wood Rodgers' 2016 PIR, a breach at any point in this

19-mile-long levee would allow water from the Yolo Bypass to enter the DWSC, and the resulting backwater could flood the Port and significant portions of the City.

The DWSC West Levee is an over-widened embankment (more than 600 feet wide in some areas) that was constructed using dredged material excavated during construction of the DWSC. This material mitigates some through seepage and underseepage issues. Without considering the presence of this "berm", through seepage and underseepage deficiencies will exist along portions of the DWSC West Levee.

Previous evaluations have indicated that removal of dredging spoils material along the DWSC West Levee's channel-side slope would lead to high exit gradients. Furthermore, existing explorations suggest that removal of material within the DWSC West Levee embankment could also cause unacceptable through seepage in some locations. The extent of allowable material removal was not studied in detail as part of the Wood Rodgers 2016 PIR, but the Urban Levee Evaluation (ULE) performed by DWR in 2012 (Reference 5) indicated that limiting material removal in the DWSC West Levee provided protection against underseepage. Therefore, borrow restrictions are associated with many of the remediation measures proposed in this levee.

Additionally, due to the levee having relatively flat waterside and landside slopes, geometry issues were not identified for this levee. Only one segment, from Station 202+00 to Station 290+00, has a potential stability issue, which is located on the channel side. Since this levee was constructed as a navigation levee associated with the DWSC, the increased freeboard criteria associated with the Yolo Bypass were not considered during the original design. Therefore, freeboard deficiencies were identified along the entire length of this levee. Erosion was identified as a concern throughout the DWSC West Levee.

In addition to these deficiencies, routine inspections conducted by DWR and USACE indicate issues with vegetation, encroachments, and penetrations. Only one moderate hazard encroachment was identified in this levee (a gas line running parallel to the landside levee toe). Since this is not considered to be a high hazard, it does not need to be modified immediately. This gas line will be reviewed against potential remediation measures in order to determine if it will likely be modified or removed as part of a future remediation project, or if it can be addressed in a long-term plan. Finally, the USACE inspections revealed issues with approximately 22 vegetation items along this levee. These items will need to be addressed as part of the Flood Program.

I. DWSC East Levee

Before the DWSC was constructed, the DWSC East Levee served as the east levee of the Yolo Bypass. With the construction of the DWSC West Levee (aka, Navigation Levee), the DWSC East Levee is now subject to the water surface elevation of the DWSC, which

is significantly lower than that of the Yolo Bypass. Underseepage deficiencies identified for the DWSC East Levee are generally a result of the presence of a landside ditch. The identified landside and waterside stability deficiencies are primarily located at existing pump stations where slopes have been steepened. Erosion was only identified as a concern at a few localized areas on this levee.

In addition to these deficiencies, routine inspections conducted by DWR and USACE revealed issues with vegetation, encroachments, and penetrations. A total of fourteen high-hazard encroachments and three high-hazard penetrations were identified in this levee. The USACE inspections revealed issues with five vegetation items along this levee. These items will need to be addressed as part of the Flood Program since they are believed to pose an unacceptable threat to levee integrity, maintenance, and flood-fight operations. Low and moderate hazard encroachments and penetrations will also be reviewed against potential remediation measures in each reach in order to determine which penetrations and encroachments are likely to be modified as part of a future remediation project (i.e.: cutoff wall), and which ones could be addressed as part of a long-term remediation plan.

J. Port North Levee

The results of this investigation indicate that the Port North Levee has only one area between Stations 26+00 and 35+50 where waterside slope stability and localized, intermittent erosion potential are a concern. Additionally, a potential for underseepage deficiency was identified from Stations 120+00 to 142+50. However, there are no explorations after Station 135+00; therefore, additional explorations are recommended to evaluate subsurface soil conditions. Furthermore, nearly the entire segment is freeboard deficient, with some areas lower than the design water surface elevation (DWSE). This is due to the fact that a noticeable levee embankment only exists from Station 0+00 to Station 125+00. Beyond Station 125+00, Industrial Boulevard essentially serves as the "levee" because the area that is waterward of Industrial Boulevard has many low spots to accommodate infrastructure associated with the Port of West Sacramento. Additional explorations and geotechnical analysis should be conducted to confirm that no additional geotechnical deficiencies will result from future freeboard mitigation measures, especially from Stations 8+00 to 26+00, Stations 35+00 to 120+00, and Stations 142+50 to 236+00.

In addition to these deficiencies, routine inspections conducted by DWR and USACE revealed issues with vegetation, encroachments, and penetrations. Only two low-hazard and moderate-hazard penetrations were identified in this levee. Since they are not high hazard, these penetrations do not need to be modified immediately. These penetrations will be reviewed against potential remediation measures in each reach in order to determine which ones are likely to be modified or removed as part of a future remediation project,

and which ones could be addressed in a long-term plan. Vegetation issues were not identified for the Port North Levee.

K. Port South Levee

The Port South Levee evaluation indicates that, generally, there is a potential for underseepage between Stations 23+00 and 123+50 and through seepage from Stations 143+00 to 186+93. Steep waterside slopes along the eastern end of this levee may result in in waterside slope instability associated with rapid draw-down from Station 138+00 to Station 158+00. Finally, this segment has freeboard deficiencies along its entire length. Additional explorations and geotechnical analysis should be conducted to confirm that no additional geotechnical deficiencies will result from future freeboard mitigation measures. Erosion was not identified as a concern in this levee. The Port South Levee was the only levee in the study area that was not included in the USACE and DWR Periodic Inspections. A site-specific review of this levee should be performed in future iterations of Wood Rodgers' 2016 PIR before any improvements are made to this levee.

III. ALTERNATIVES CONSIDERED

The deficiencies presented in the previous section include seepage, stability, freeboard, geometry, erosion, vegetation, and penetrations/encroachments. This section discusses the measures that are typically used to address each of these types of deficiencies.

- A. Seepage and Stability Mitigation Measures
 - 1. Cutoff Walls

Cutoff walls reduce levee underseepage and through seepage by providing a barrier of low permeability material through the levee and levee foundation where sandy or gravelly soils of higher permeability can transmit seepage during high water stages. Cutoff walls are installed to the depth determined by geotechnical analysis to reduce underseepage and through seepage at the DWSE to gradients that satisfy seepage criteria specified by the ULDC.

Based on previous cutoff wall projects in northern California, the cutoff wall alternatives presented in this AAR target a soil-bentonite wall (described in more detail below) with a levee degrade equal to one-half of the existing levee height as measured from the landside levee toe. While some projects in California's Central Valley have reduced this degrade to one-third of the levee height, a one-half levee degrade is assumed for the purposes of this initial Flood Program analysis. The degrade limits will be reviewed in greater detail during the design phase. The greater degrade amount reduces a number of risks by placing the wall deeper within the levee prism: 1) susceptibility to burrowing rodents; 2) the potential for hydraulic fracture during wall construction; and 3) potential for the wall to fail in the event of a circular slip-type failure at the levee waterside face. For very wide levees (widths in excess of 100 feet), the amount of degrade was reduced as needed to provide a minimum 30-foot-wide cutoff wall working platform. Each of the various cutoff wall types, construction methods, and costs are described below. A summary of this information is also included as **Table 2** (attached).

a. Types of Cutoff Walls

Cutoff walls can be constructed using a number of different methods to suit site conditions and required cutoff wall depth. Traditional types of cutoff wall construction include soil-cement-bentonite (SCB) cutoff walls, soil-bentonite (SB) cutoff walls, and cement-bentonite (CB) cutoff walls. The type of wall chosen depends on the desired properties of the finished wall. Each of these wall types is described below.

<u>SCB Cutoff Walls</u> – SCB cutoff walls are constructed by degrading the existing levee by one-half (or an amount to provide at least a 30-foot-wide working

platform) followed by the excavation of a minimum 36-inch-wide trench down the levee centerline using a hydraulic long-reach excavator. A bentonite slurry is then pumped into the excavated trench in order to maintain sidewall stability while a mix of bentonite slurry, select native material (or a combination of native and import material), and cement is processed and placed into the trench. For levee cutoff walls, the mixture is designed to produce a wall with a permeability of typically 5x10-7 cm/sec at 28 days and a compressive strength ranging from 40 to 300 psi at 28 days (design permeability is 1x10-6 cm/sec; however, to assure that this is reached by the completed wall, the specifications target 5×10^{-10} 7 cm/sec). SCB cutoff walls constructed by the traditional, long-reach excavator method are typically feasible up to approximately 85 feet. Constructing a SCB cutoff wall deeper than 85 feet typically requires adding a hydraulic clamshell to excavate to the required depth. The costs for constructing a typical SCB cutoff wall to conventional depths range from \$8-\$18 per square foot, depending upon depth, width, and quality control requirements. Typical mobilization costs for conventional SCB installation are \$75,000-\$125,000. Due to increased costs of SCB walls with respect to SB walls, shallow SCB walls were not proposed as part of this analysis. Where deep wall are proposed, SCB wall constructed with the Deep Soil Mixing (DSM) method are recommended in this Report.

<u>SB Cutoff Walls</u> – SB cutoff walls are constructed similar to SCB cutoff walls and have the same depth limitations; however, cement is not included in the slurry mix. SB cutoff walls, if not protected sufficiently, can be susceptible to subsidence and damage by equipment loads on the levee surface.

Since the permeability of SB cutoff walls is relatively predictable compared to SCB walls, construction is able to move forward without first completing a testing program to select a mix design. This predictability also allows cutoff wall field permeability to target the design permeability, which is normally 1x10-6 cm/sec, verses a lower permeability of 5x10-7 for SCB walls.

Typically, there are limitations on the materials comprising SB backfill. To achieve good mixing of the materials, SB backfill soils must contain fines (materials passing the No. 200 Sieve) in the range of 20-40 percent. If the existing material is higher than 40 percent passing the No. 200 Sieve, this could require importing and mixing SB backfill materials.

Typical costs for SB walls range from \$7.50-\$12.00 per square foot depending upon the effort required to meet the materials specification. Typical mobilization costs for conventional SB installation are \$75,000-\$125,000.

CB Cutoff Walls – CB cutoff walls contain cement and bentonite only. A trench for the wall is constructed and the excavated material is hauled off-site or incorporated into earthwork portions of the project (such as levee raising or slope flattening). CB walls require a smaller construction footprint (as small as 20 feet wide). Therefore, CB walls are good options where one-half degrade or wider working platforms are not feasible. CB walls are typically constructed in alternating panels, with the intermediate panels constructed once the first panel sections have had several days to cure. Alternatively, the CB wall can be constructed using the continuous trench method; however, this requires trimming and disposing of a portion of the previous day's work if the work is discontinuous overnight. CB walls begin to set within hours, and backfill over the trench can proceed after a short period of curing. If desired permeability is 1x10-6, CB walls can be in the general cost range of SCB and SB walls; however, target permeabilities lower than $1 \times 10-6$ cm/sec require specialized slag cement mixtures that significantly add to the cost. Basic CB walls typically range in cost from \$20 to \$30 per square foot. Typical mobilization costs for conventional CB installation are \$75,000 to \$125,000.

b. Cutoff Wall Construction Methods

Each of the walls described in the previous section can be constructed using convention methods (i.e.: with a long-stick excavator). The maximum depth of conventional construction methods is approximately 85 feet. Where deeper walls are required, alternative equipment methods can be employed such as deep soil mixing (DSM), trench cutting and remixing (TRD), cutter-soil mixing (CSM) and jet grouting. Each of these equipment types and methods are described below.

<u>DSM</u> – Deep Soil Mixing (DSM) is a second method for installing SCB or SB cutoff walls at greater depths (80 feet to 200 feet) is using DSM. DSM produces a wall of similar permeability and strength characteristics as a conventional cutoff wall, but can be constructed to greater depths. DSM is accomplished with specially-designed drilling equipment that drills into the subsurface soils, injects cement and bentonite slurry, and mixes the materials in place to form a column of low permeability material. A series of overlapping columns are constructed to form a continuous wall. DSM can be performed to create a SB cutoff wall, but this method has a limited history in California and, where it has been used, has experienced anomalous results. DSM is more expensive than conventional cutoff walls (\$20-\$30 per square foot for SCB). Typical mobilization costs for DSM walls are \$100,000-\$150,000.

<u>TRD</u> – The Trench Remixing, Deep (TRD) method, also referred to as the "Chainsaw Method," utilizes a continuous vertical chain bucket excavator to cut a trench along the alignment of the proposed cutoff wall. While excavating, the TRD equipment dispenses a cement-bentonite slurry into the soil and mixes the slurry with the cement-bentonite to achieve the required cutoff wall strength and permeability. A TRD machine can achieve a cutoff wall depth of up to 200 feet. Similar to DSM, the TRD method does not become economical until the cutoff wall depth exceeds the limit of conventional equipment. Sharp turns in levee alignment can also slow production rates. Typical costs for TRD wall construction, through a straight levee alignment with favorable subsurface conditions, is 20-30 per square foot. Typical mobilization costs for TRD walls are 150,000 to 200,000.

<u>CSM – The Cutter Soil Method (CSM) - CSM</u> uses two counter-rotating cutting heads at the end of a long shaft to break up subsurface materials, inject slurry, and mix the components into a homogenous mass. This method of cutoff wall construction works particularly well where hard or rocky subsurface conditions are present. A drawback of this wall is the minimal overlap provided between panels of completed wall, which are typically four inches, and can be reduced if the stem of the auger is not maintained vertically during driving. Similar to the other hydromill methods, the CSM method requires that a drill rig pre-drill along the wall alignment and classify the subsurface soils in advance of the CSM machine. Degrade of the levee to provide a minimum working platform of 30 feet is desirable for this equipment

<u>Dewind One-Pass Trencher Method</u> – The Dewind One-Pass Trencher is a proprietary cutoff wall construction machine that has completed many cutoff walls through the United States (mainly for dewatering applications). It is similar to the TRD equipment in the mixing method, but its mixing boom is situated on a large excavator chassis. This equipment arrangement has cost efficiencies and production advantages that may be well suited for levee rehabilitation work in California. However, it has not yet been used in California, and has not (in Wood Rodgers knowledge) been used on a federallyowned levee. Wood Rodgers understands that the Sacramento Area Flood Control Agency (SAFCA) may be set to use this equipment on a North Area Streams project in the near future. If the equipment is used and performs well, it may be considered further in upcoming phases of the City's Flood Program.

<u>Jet Grouting</u> – Jet grouting is a general term used to describe construction techniques where high-pressure fluids or binders are injected into the soil at high velocities (800 to 1,000 feet per second). Depending upon the depth of grouting required and the subsurface material encountered, the injected fluid may be comprised of grout; grout and air; or grout, air, and water. Jet grouting breaks up the soil structure and mixes the soil particles in-situ, with a binder to create a homogeneous mass. In time, this mass solidifies to form a prism of low permeability material. Jet grouting is particularly useful where obstructions along the path of the wall do not allow the use of other methods. As noted, jet grouting can entail a number of construction techniques and equipment variants that add significant uncertainty to the cost. For the purposes of budgeting, a cost of between \$75 and \$150 per square foot is appropriate. Typical mobilization costs for jet grout walls are \$250,000-\$500,000.

c. Cutoff Wall Location

Cutoff walls are typically constructed either near the levee centerline or at the levee waterside toe. Constructing the wall at the levee waterside toe decreases the quantity of cutoff wall square footage; however, a blanket of low permeability material is required at the waterside slope face. Existing levee excavation and reconstruction quantities vary in relation to a typical degrade, depending on the degrade height used. A typical section for a cutoff wall at the levee centerline is presented on **Figure 3** (attached). A typical section for a cutoff wall at the waterside levee toe is presented on **Figure 4** (attached).

2. Seepage Berms

Seepage berms provide mitigation for levee underseepage by extending the seepage path away from the landside levee toe, and adding weight to counteract upward seepage forces. The ULDC provides guidance that seepage berms should be at least four times the minimum top-of-levee (MTOL) height with a maximum width of 300 feet. Seepage berms also provide protection against the landside slope slumping at the levee toe. There are different types of seepage berms including impervious, semi-pervious, sand, and free-draining. The preferred configuration, similar to a free-draining seepage berm, incorporates a soil mass, a drainage layer, and a filter layer to control the flow of seepage through the levee. Collection systems are not typically designed to accompany drained seepage berms because it is assumed that seepage flow emanating from the seepage berm would not increase over existing conditions. A typical seepage berm configuration is presented on **Figure 5** (attached).

3. Stability Berms

Stability berms provide protection against through seepage and landside levee slope failure by buttressing the levee slope and draining levee through seepage. Stability berms have been identified as an option only where through seepage (and not underseepage) is of concern, and a stability berm is not already present. A typical stability berm configuration is presented on **Figure 6** (attached).

4. Slope Flattening/Reconstruction

Slope flattening and reconstruction help improve the stability of waterside slopes. Along the Yolo Bypass, slope stability issues will be addressed using details from recent USACE repair work completed as part of Contract C, Contract D, and slump repairs completed in 2002. Typical sections for these repairs are shown in **Figures 7**, **8**, and **9** (attached), respectively.

5. Relief Wells

Relief wells provide protection against levee underseepage by providing a path for underseepage pressures to exit to the landside ground surface without piping levee foundation materials. Relief wells are only an option in areas where continuous sand and gravel layers and a continuous, low-permeability, fine-grained clayey blanket have been identified by the geotechnical analysis. Wells are typically constructed with six-inch to eight-inch stainless steel screens and casings, and they discharge into a concrete-lined ditch running parallel to the landside levee toe. Seepage in the collection ditch is then routed either to an existing drainage system or pumped back over the levee. Relief well discharge requires water quality permitting. Piezometers are also installed within the relief well field to monitor relief well performance. A typical relief well and piezometer detail are presented on **Figure 10** and **Figure 11** (attached), respectively.

Due to the water quality permitting, increased operation and maintenance, and vandalism concerns, relief wells are only considered as a seepage remediation measure in limited circumstances where cutoff walls and berms are impractical.

6. Typical Treatment at Transitions

Where different seepage mitigation measures are installed in adjacent reaches, overlapping the treatments is required to transition from one measure to another. For example, if a cutoff wall is constructed for Reach A, and a seepage berm is installed for Reach B, then the cutoff wall of Reach A would need to extend into Reach B and the seepage berm may need to extend into Reach A. **Figure 12** (attached) shows a typical detail for the transition overlap between a cutoff wall and a seepage berm. Reaches with a seepage mitigation

measure to be constructed adjacent to a reach with no new seepage mitigation measure would be extended to overlap into the untreated area.

- B. Freeboard Mitigation Measures
 - 1. Levee Raising

Levee raising increases the height of a levee by adding additional embankment material to the existing crown and landside slope in order to create a taller levee. The levee crown would be raised to the height needed to contain the DWSE plus freeboard (typically three feet). Raised levees generally become five to six feet wider for every one foot they get taller since both the waterside and landside slopes of new and/or improved levees is 2H or 3H:1V. Typically, levee raises occur by projecting a 3:1 theoretical waterside slope to the top of the new levee crest (beginning at the waterside toe), and then incorporating a 20-foot crown width. In this way, a levee raise is built landward of the existing levee prism. Therefore, land acquisition at the landside levee toe is typically necessary in order to accommodate the wider levee footprint. Where hydraulic and environmental analysis allow, extending the levee footprint waterward may be considered. Finally, where the freeboard deficiencies are very minor (i.e.: less than six inches), alternative measures of achieving the required height such as constructing a cap on the crown, or using steeper side slopes to minimize the disturbance of the entire levee footprint may be considered during future phases of the Flood Program. A typical levee raise is presented on Figure 13 (attached).

2. Floodwalls

A floodwall is essentially a concrete retaining wall that provides flood protection by creating a vertical barrier between high water and the area it protects. Where floodwalls are used, they usually are designed to meet the same height and freeboard criteria as levees. Construction of floodwalls is generally more expensive than constructing a new levee. For this reason, floodwall applications are typically implemented only in areas where the available right-of-way is limited. For this AAR, floodwalls were not considered as a preferred freeboard mitigation measure on any levee except the Port North Levee. A typical floodwall is presented on **Figure 14** (attached).

C. Geometry Mitigation Measures

Where seepage berms, stability berms, and/or levee raising are proposed, these measures may also address geometry issues. Where these measures do not add sufficient material to the existing levee to contain a theoretical ULDC prism within the embankment, the levee prism is expanded landward of the existing levee prism as needed so that the theoretical geometry prism exists within the new levee.

D. Erosion Mitigation Measures

Erosion mitigation measures will be needed to repair identified erosion and to protect against erosion in areas where the levee bank will be exposed by new construction. Erosion protection solutions will be designed primarily to address mechanisms that cause erosion, including but not limited to:

- wave wash during high water;
- boat and wind waves;
- toe erosion due to outer bank scour;
- geotechnical failure;
- scour by currents;
- local scour due to a constriction or other features.

Secondarily, erosion protection designs will need to be compatible with bank conditions resulting from other anticipated levee repairs.

There are various means of providing erosion protection, ranging from concrete revetment to seeding and planting. Rock slope protection (RSP) is commonly used to provide flexible, durable, resistive protection in the wave wash zone, to protect against scour, and to provide slope stability. Seeding and planting is a less expensive "greener" alternative that should be considered where conditions allow. Recent experience suggests that regulating agencies may require inclusion of earth fill and vegetation in RSP designs for habitat enhancement purposes, where it is appropriate.

Repair of existing erosion sites should be completed according to a prioritization system that is based on the severity of the deficiencies.

The priority classification should be based on the following criteria:

- erosion mechanism,
- erosion severity,
- channel morphology,
- proximity to infrastructure,
- presence of previously placed slope protection,
- toe condition,
- levee classification and
- spot repairs.

Using this system, observed and potential erosion sites may be roughly classified (e.g., severe, medium and low risk). Erosion sites with highest priority (most severe) should be repaired, while medium and low priority sites should be monitored, unless their repair is justified by other concerns. In the PIR, observed erosion sites on the Sacramento West South Levee were classified according to the three categories above. In all other levee reaches, two classes of erosion – "minimally acceptable" and "unacceptable" – were documented for existing erosion sites by HDR, Inc. (HDR). This alternatives analysis recommends repair of "high priority" erosion sites on the Sacramento West South Levee and "unacceptable" erosion sites on all other levees, with one exception. Repair of minimally acceptable erosion sites on the DWSC West Levee is recommended because the erosion mechanism of concern (wind waves) is similar for all portions of this levee, so over time it is anticipated that the minimally acceptable sites will become unacceptable and will need similar repairs. Newly exposed soils in areas being constructed or repaired for other reasons will require soil stabilization by seeding, at a minimum, and may require more robust treatment depending on circumstances.

Erosion repair concepts recommended by this Report are discussed below.

1. Riprap or Rock Slope Protection

Rock slope protection is one measure considered in this Report to address areas where erosion is a concern. RSP can be used as a standalone measure, included in a wave rock bench, or used in combination with vegetation. Each of these measures is described in more detail below.

a. Wave rock benches are included as an alternative to resist wave erosion, and are typically located just below average annual high water. Depending on the site location on the river and bank condition, the repair might include rock coverage down to the bank toe. Wave rock bench designs typically include soil fill and installed vegetation on the bench and on the bank landward of the bench.

b. Rock slope protection is also presented as a singular bank protection alternative that comprises riprap placed from the toe to the crown of the levee where waves and currents are the mechanisms of concern. Typical details for singular RSP installations can be found on Figure 9 (attached).

c. Vegetated riprap is presented as an alternative for sites where it will be helpful to match existing conditions and satisfy anticipated permitting needs. Vegetated riprap designs include planting willow cuttings (poles) through the riprap blanket. The willows are intended to slow flows near the bank, help anchor rock and stabilize slopes and to provide habitat. Please refer to **Figure 15** (attached) for a typical detail of this measure.

E. Penetration and Encroachment Mitigation Measures

Penetrations typically include pipe or conduit crossings through the levee embankment and its foundation. Penetrations are a concern to levee integrity since they have the potential to produce rapid breaching via preferential seepage paths or an open conveyance for floodwaters if they penetrate the levee below the DWSE.

Encroachments typically include utility poles, fences, gates, ramps, or other structures that are within the levee prism, within the channel, or are located within 20 feet of the landside toe. Encroachments are a concern to levee integrity since they can interfere with channel hydraulics, levee operation, maintenance, inspection, or flood fight capability. In some cases they can present a preferential path for seepage or interrupt confining layers that would otherwise minimize seepage gradients.

Penetrations and encroachments were evaluated in Wood Rodgers' 2016 PIR to determine if they presented a low, moderate, or high hazard to levee integrity. Mitigation measures for the different hazard levels are presented below.

1. Low Hazard Penetrations and Encroachments

These penetrations and encroachments represent a low hazard to levee integrity and have minimal impacts to operations, maintenance, and flood fight capability. For penetrations and encroachments that were identified as having a low hazard potential and are permitted, no action is necessary. A plan to permit currently unpermitted penetrations and encroachments identified as a low hazard potential should be developed in future phases of the Flood Program. Whether permitted or not, if low hazard penetrations and encroachments require removal/modification incidental to a proposed seepage, stability, erosion, geometry, or freeboard remediation project, they will need to be relocated/modified as part of the larger project. Alternatively, these penetrations and encroachments can be addressed through a long-term plan.

2. Moderate Hazard Penetrations and Encroachments

These penetrations and encroachments represent a moderate hazard to levee integrity and may have moderate impacts to operations, maintenance, and flood fight capability. Permitted and unpermitted penetrations and encroachments that were identified as having a moderate hazard potential should be developed in future phases of the Flood Program. If moderate hazard penetrations and encroachments require removal/modification incidental to a proposed seepage, stability, erosion, geometry, or freeboard remediation project, they will need to be relocated/modified as part of the larger project. Alternatively, these encroachments can be addressed through a long-term plan.

3. High Hazard Penetrations and Encroachments

These penetrations and encroachments represent a high hazard to levee integrity and/or operations, maintenance, and flood fight capability. For penetrations and encroachments identified as having a high hazard potential, the City should either: 1) perform a full engineering evaluation of high hazard penetrations and encroachments to demonstrate that the hazard is acceptable; or, 2) remove or modify the penetration/encroachment. If high hazard penetrations and encroachments require removal/modification incidental to a proposed seepage, stability, erosion, geometry, or freeboard remediation project, they will need to be relocated/modified as part of the larger project. A typical detail for a penetration modification including the installation of a positive closure device is shown in **Figure 16** (attached).

F. Vegetation Mitigation Measures

The ULDC provides guidance for vegetation management that incorporates levee integrity; visibility; and accessibility for inspections, maintenance, and flood-fight operations, while protecting critical environmental resources and habitat offered by existing vegetation.

For existing vegetation that does not pose an unacceptable hazard threat to levee integrity, the ULDC recommends adopting a Life-Cycle Management (LCM) approach. This policy is aimed at limiting the financial costs associated with extensive vegetation removal and potentially significant loss of habitat along levees. Under the LCM approach, levees containing legacy trees along the landside or waterside slopes will be managed to allow vegetation and trees to live out their normal life cycles except where they pose a threat, while gradually progressing (over several decades) toward the current USACE policy of eliminating woody vegetation from the Vegetation Management Zone (VMZ). The LCM approach protects and improves riparian habitat as long as the vegetation does not impair visibility and accessibility. The levee crown must be kept free of all vegetation since it serves as a patrol road for levee maintenance. **Figure 17** (attached) depicts the VMZ and associated criteria for vegetation on existing levees.

For this AAR, vegetation will be removed within the VMZ as needed to accommodate a seepage, erosion, or freeboard improvement project. Existing vegetation within the VMZ that does not need to be removed to accommodate a remediation project will be allowed to remain. Since most levees considered in this AAR require some form of improvement that impacts the waterside slope (e.g., freeboard raising, cutoff wall, etc.), it is expected that many of the existing vegetation issues will be addressed concurrently with a repair/remediation project. Future phases of the Flood Program may conduct engineering assessments to determine if vegetation that is allowed to remain poses an unacceptable risk to levee integrity.

G. Right-of-Way

Based on discussions with the project team, existing right-of-way is assumed to extend 10 feet landward of the landside toe to 15 feet waterward of the waterside toe for most levees considered in this AAR. Therefore, it is assumed that the minimum ULDC criteria are met for most levees. The notable exceptions are the Port North, Port South, and DWSC West Levees where the Port is assumed to own all of the land in these areas. Right-of-way is assumed to be needed for all improvements in these levees. Outside of the Port North, Port South, and DWSC West Levees, land acquisition needs have been estimated where seepage and stability berms are proposed and are included in the respective cost estimates.

Land acquisition estimates also consider a 20-foot future needs area landward of proposed improvements (where land appears to be available). A 20-foot future needs area is included waterward of proposed improvements where it is not expected to impact sensitive riverine or aquatic habitat areas (this was generally limited to the Port levees).

IV. BASIS OF COSTS

To estimate preliminary project costs, unit prices were developed and material quantities were calculated for the project features. Geotechnical remediation measures were based on information provided in **Attachment A** (attached). Estimated quantities for each alternative in each reach were developed using specific cross sections taken at locations where the existing levee geometry was representative of a "typical" section in that reach. Cross sections that were used to estimate quantities for the alternatives considered in each reach are included in **Attachment B** (attached). Unit prices for typical levee construction (e.g.: site clearing, borrow excavation and hauling, levee embankment fill, rock slope protection, riparian corridor construction, and roadway construction) were determined based upon recent contractor bid summaries for similar levee improvement projects in Northern California. Where recent bid tabulations were not available, cost-determination publications, such as RS Means' *Heavy Construction Cost Data*, were used to develop costs.

For purposes of this AAR, levee degrade material is assumed to be stockpiled and replaced. It was assumed that 80 percent of the degrade material could be reused, and 20 percent would have to be hauled off and disposed. Since the DWSC West Levee consists of an over-widened embankment, the unsuitable material was assumed to be disposed of along this levee, which eliminated hauling and disposal costs for this levee. Clay cap material placed on top of proposed cutoff walls and levee embankment material in order to address freeboard/geometry deficiencies is assumed to come from borrow sites. Seepage berm fill is also assumed to come from project excavations and borrow sites. Although specific borrow sites have not been identified, this AAR assumes that borrow material will come from within City. The most likely sources for borrow material are located in the southern part of the City, south of Port South. This assumption limits most hauling

distances to a maximum of 10 miles (one-way). For embankment material in the DWSC West Levee, material is assumed to come from within the DWSC or the Yolo Bypass. Borrow material shrinkage is assumed to be 30 percent, and borrow acreages were estimated assuming a borrow depth of five feet.

The cost estimates include a contingency amount of 30 percent for all items, except land acquisition costs, where a 15 percent contingency was used due to less uncertainty associated with these items. Due to the increased uncertainty of possible impacts to buildings and utilities in Port North, a 50-percent contingency was applied in many reaches within that levee. Planning, engineering, and design were included at seven percent. Environmental mitigation and planning/permitting costs were developed for each levee reach by Ascent Environmental, Inc. based on a review of proposed improvements and the project footprint. Right-of-way costs were developed by Bender Rosenthal, Inc. and were informed by recent land sales of agricultural, residential, and commercial/industrial properties in the vicinity of the project.

Cost estimates reflect 2015 costs, escalated to 2019 costs at a rate of 2.5 percent per year. This escalation rate was determined from a review of the Engineering News Record (ENR) Historical Cost Index for the years of 2012 through 2015. Unit costs used for this Report are presented in **Table 3** (attached). Detailed cost estimates for each levee system are included in **Attachment C** (attached).

V. BASIS OF ANALYSIS

The potential alternatives were evaluated with respect to the following criteria: cost, constructability, effectiveness, operation and maintenance requirements, and flexibility. This section presents the considerations associated with each of these evaluation criteria.

A. Cost

Given the quantity of levee improvement work that is needed to address the identified deficiencies and the limited resources available to fund improvements, cost is often an overriding consideration in selecting the recommended alternative. Thus, cost is the focus of the comparative evaluations and tables included in this Report. Cost is also the only objective comparison measure used as a basis for analysis of alternatives.

Typically, if land is available landward of the levee toe and borrow material can be acquired at a reasonable cost, seepage berms are often the least cost alternative. Where subsurface conditions require a wider berm (greater than four times the levee height), or where environmentally-sensitive areas or existing infrastructure are located landward of the levee, costs for seepage berms can increase significantly or become prohibitive.

Most existing erosion protection consists of RSP, and costs considered herein are for repair of existing revetment or addition of protection to existing unprotected erosion sites. Initial

costs for levee erosion protection generally reflect the erosion resistance of the protection measure (i.e. concrete is more costly than riprap, which is more expensive than revegetation).

Vegetated benches were generally selected for new erosion protection structures as this is a proven alternative with attractive features with respect to environmental impacts. The vegetated bench design for toe protection may cost more due to the expanded rock prism that is required to construct it, but it is a design we anticipate needing in order to meet permitting requirements. In areas where RSP was recommended, it was viewed as the most economical solution from the standpoint of reducing future maintenance. The repair alternatives provided are based on our experience with similar requirements on local projects. Although detailed cost comparison analysis was not completed, qualitative assessment and professional judgment indicated that these are cost-effective strategies.

B. Constructability

Constructability considerations include construction impacts that may affect overall project costs but that may not be directly accounted for in a construction cost estimate. Such impacts include air quality (for large earthwork and earthwork hauling operations), staging area needs, level of construction quality assurance (QA) monitoring required, and impacts to surrounding infrastructure (such as traffic delays on local roadways and potential use fees or replacement costs to address hauling damage).

Cutoff walls typically are the easiest to construct as they are located within the existing levee footprint and require minimal hauling or impacts to local traffic.

Seepage berms can have a significant impact in that they require large volumes of material to be hauled from an off-site source. As a result, such impacts can have detrimental effects on air quality, traffic, and existing roadway infrastructure.

Similarly, construction of erosion mitigation measures can have constructability considerations. Repairs require hauling and staging of large amounts of material (principally earth and stone). Construction may require heavy equipment and staging from the waterside that can potentially affect recreational use of waterways. Erosion repairs can also present regulatory issues such as habitat degradation, as in-water work and vegetation clearing are often required, so biological and water quality monitors may be required, and waterside construction may be limited to strict seasonal windows.

Constructability was considered qualitatively for alternatives analyzed in this Report, and where constructability was deemed a substantial concern for a given alternative, it was screened out.

June 1, 2016

C. Effectiveness

In general, if installed correctly and maintained properly, all seepage mitigation measures under consideration in this AAR are effective in reducing through and underseepage gradients to within ULDC criteria. Likewise, erosion mitigation measures are effective when constructed and maintained property.

D. Operation and Maintenance Requirements

Cutoff walls require no operation and maintenance (O&M) effort and, therefore, are highly desirable by maintaining agencies. Seepage berms, because they periodically require mowing and some inspection, would require an increased level of O&M. However, because this level of increased maintenance is generally minor, it is not enough to screen out a seepage berm alternative.

Erosion protection measures involving vegetation require more frequent inspection and maintenance, especially during the period of establishment. Irrigation may be required, as well as control of the beaver population or invasive plant species. Erosion solutions that present the potential for ongoing O&M were considered here in light of their ability to meet the above criteria and the potentially restrictive cost of alternatives.

O&M is used as a subjective consideration for selecting a preferred alternative. O&M cost estimates for each alternative were not included.

E. Flexibility

Given the dynamic nature of the levee design, construction, and maintenance criteria, flexibility to build upon current improvements in the future is an important consideration. With respect to changing underseepage criteria, seepage berms offer the most flexibility because additional material can be placed on the seepage berm to increase its capabilities. Cutoff walls offer little flexibility in response to changing criteria and industry practices.

With respect to future levee widening, raising, and landside slope flattening, both seepage berms and cutoff walls offer sufficient flexibility to increase the levee geometry without affecting completed seepage improvements. Similarly, erosion protection and repairs are typically compatible with future levee improvements because they are located on the waterside of the levee, and improvements typically affect the interior of the embankment (cutoff walls) or landside (berms). Erosion protection and repairs are easily modified by adding more material (fill, gravel, stone, plants, geotextile). Flexibility was considered qualitatively for alternatives analyzed in this AAR.

VI. ALTERNATIVES ANALYSIS

Alternatives to address deficiencies identified in Wood Rodgers' 2016 PIR were developed by Blackburn Consulting (BCI), CBEC, Inc. (CBEC), and Wood Rodgers. Each levee segment was divided into reaches of similar deficiencies and recommended remediation measures. **Table 4** (attached) presents the alternatives considered in each reach. Table 3 also includes the minimum seepage and stability remediation measures that might be supported if additional exploration and evaluation is conducted. This is discussed in more detail in Section VIII.

A description of the alternatives developed to address identified deficiencies for each reach are included below.

- A. Sacramento River West North Levee
 - 1. Reach 1 (Station 0+00 to Station 71+50)
 - a. Alternative 1 –Levee Raising with Shallow CB Cutoff Wall

A minimum 36-inch-wide, 45-foot-deep cutoff wall could be constructed (to elevation zero) to address through seepage issues in Reach 1. Between Stations 0+00 and 30+00, North Harbor Boulevard is situated on the levee crest. Since this is the only access road in this area, a CB wall is the preferred cutoff wall type due to a slightly smaller construction footprint (20 feet). This would allow traffic to be routed around the construction staging area with the use of flaggers. In the vicinity of the Bryte Bend Maintenance Yard, the cutoff wall would traverse the pavement in the parking areas, since the area outside of this facility along the waterside and landside hinges is not large enough to construct a cutoff wall.

The Reach would also need to be raised as much as six inches between Stations 54+58 and 56+43 and up to eight inches between Stations 58+19 to 61+19. All of the 11 utility penetrations within this segment would need to be modified due to the installation of the cutoff wall. There are approximately 18 high-hazard encroachments that also need to be modified and/or relocated in this Reach. This alternative would not require additional right-of-way since the levee footprint is not expected to change significantly.

The estimated cost for this alternative is approximately \$23.4 million. This may be reduced with future maintenance if landside slope slumping due to through seepage is observed during and after prolonged high water events, as discussed in Section VIII of this Report.

b. Alternative 2 – Minor Levee Raising and a Drained Stability Berm

A 10-foot-wide stability berm is another alternative that could address through seepage issues in Reach 1. Due to the presence of the UPRR tracks immediately adjacent to North Harbor Boulevard from Stations 0+00 to 30+00, and the proximity of Riverbank Road between Stations 30+00 and 50+00, implementation of this remediation measure would involve costly rail and roadway relocations. For these reasons, the stability berm alternative was considered infeasible and, therefore, screened out.

2. Reach 2 (Station 71+50 to Station 101+00)

The Rivers EIP Project addressed known deficiencies in this Reach. The USACE inspections identified several utilities that were installed as part of The Rivers EIP project as being unacceptable. For purposes of this AAR, these utilities are assumed to have been constructed in compliance with USACE and DWR requirements and, therefore, do not require modification as part of the Flood Program. Future iterations of Wood Rodgers' 2016 PIR may conduct additional exploration/ evaluation of these utilities in order to assemble the documentation necessary for USACE inspections to reflect these items as "acceptable".

- 3. Reach 3 (Station 101+00 to Station 136+00)
 - a. Alternative 1 Shallow Cutoff Wall

A minimum 36-inch-wide, 40-foot-deep cutoff wall is an alternative that could be constructed (to elevation zero) to address through seepage issues in Reach 3. River Crest Drive is the approximate levee centerline, and eleven homes exist atop the wide levee crest in this Reach. These existing improvements would pose a challenge to construction of a cutoff wall in this Reach. For this reason, the cutoff wall alternative was determined to be infeasible in this Reach.

b. Alternative 2 – Drained Stability Berm

A 10-foot-wide drained stability berm is another alternative that could be constructed to address through seepage issues in Reach 3. The stability berm would be constructed along the existing landside toe of the levee. The area where the berm would be constructed appears to be open space along Fountain Drive, but the seepage berm at the northern end of this Reach may require acquisition of right-of-way on two residential parcels. For conservative cost estimating purposes, it is assumed that these two properties would need to be acquired.

The USACE inspections identified five encroachments in this Reach as being unacceptable since they pose a high hazard to levee integrity. One of the encroachments is a building at the southern end of the Reach near Station 132+00. This appears to have been constructed at the same time as the acceptably-rated (and permitted) houses along River Crest Drive near Station 102+00. It is assumed that this building could be permitted in future phases of the Flood Program by providing the necessary information to USACE to give this encroachment an acceptable rating. Two other unacceptable encroachments are newly installed waterlines that the USACE inspection requested additional information on so that these could be permitted. Future iterations of Wood Rodgers' 2016 PIR may conduct additional exploration/ evaluation of these encroachments in order to assemble the documentation necessary for USACE inspections to reflect these items as acceptable. Therefore, these encroachments are not considered as needing modification with the stability berm alternative in this Reach.

The remaining unacceptable encroachments include a monitoring well and an existing fence at the landside toe. These encroachments would be removed, relocated or modified incidental to the construction of the stability berm.

In addition to acquisition of the two homes near Station 102+00, a new right-of-way would need to be acquired along the landside toe of the levee to accommodate the new seepage berm. This alternative would require a total of approximately 5.5 acres of new land acquisition to accommodate the berm.

The estimated cost for this alternative is approximately \$5.2 million. This may be reduced with future maintenance if landside slope slumping due to through seepage is observed during and after prolonged high water events, as discussed in Section VIII of this Report.

- 4. Reach 4 (Station 136+00 to Station 152+00)
 - a. Alternative 1 Minor Levee Raise with Deep Cutoff Wall

A minimum 36-inch-wide, 100-foot-deep cutoff wall could be constructed (to elevation -55) to address steady-state underseepage and slope stability issues in Reach 4. The levee would also need to be raised as much as six inches between Stations 148+58 and 152+00. There is only one penetration in this Reach according to the USACE inspections (a three-inch PVC waterline) that would need to be modified due to installation of the cutoff wall. There are no other known penetrations in this Reach.

The USACE inspections also identified five encroachments in this Reach as being unacceptable since they pose a high hazard to levee integrity. One of the encroachments is the Regatta residential development. It is assumed that this complex could be permitted in future phases of the Flood Program by providing the necessary information to USACE to give this encroachment an acceptable rating. Therefore, this encroachment is not considered to need modification with the cutoff wall alternative in this Reach.

The remaining unacceptable encroachments include utility poles, concrete rubble, and fences along the levee. These encroachments would be relocated or modified incidental to the construction of the cutoff wall. This alternative would not likely require additional right-of-way since the levee footprint is not expected to change significantly. The estimated cost for this alternative is approximately \$7.7 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

b. Alternative 2 – Minor Levee Raise with a Seepage Berm

A 150-foot-wide seepage berm is another alternative that could address seepage issues in Reach 4. The seepage berm width was based on a limited review of the existing explorations and evaluations in this levee segment where a berm slightly wider than the minimum berm width may be required. However, due to the existing Regatta residential development located immediately adjacent to the landside toe of the levee approximately from Stations 140+00 to 148+00, this alternative was not considered feasible and was therefore not considered in this study.

- 5. Reach 5 (Station 152+00 to Station 161+00)
 - a. Alternative 1 Waterside Slope Flattening with a Deep Cutoff Wall

A minimum 36-inch-wide, 125-foot-deep cutoff wall could be constructed (to elevation -85) in order to address steady-state underseepage issues in Reach 5. The waterside slope would be flattened and armored with RSP to address rapid drawdown slope stability and erosion issues. A moderate-hazard pipeline associated with a water treatment facility will need to be modified due to installation of the cutoff wall. There are no other known penetrations in this Reach.

The USACE inspections also identified four encroachments in this Reach as being unacceptable since they pose a high hazard to levee integrity. Three of these are utility poles, concrete rubble, and fences. The fourth unacceptable

encroachment is an irrigation system for the plantings along Lighthouse Drive at the landside toe of the levee near Station 160+00. All of these encroachments will be removed, relocated, or modified in conjunction with the cutoff wall project.

This alternative would not likely require additional right-of-way since the levee footprint is not expected to change significantly.

The estimated cost for this alternative is approximately \$6.9 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

b. Alternative 2 – Waterside Slope Flattening with a Seepage Berm

A 150-foot-wide seepage berm is another alternative that could address seepage and stability issues in Reach 5. The seepage berm width was based on a limited review of the existing explorations and evaluations in this levee segment, where a berm slightly wider than the minimum berm width may be required. However, due to the proximity of Lighthouse Road to the existing landside levee toe in this Reach, this alternative was not considered feasible and was therefore not considered in this study.

- 6. Reach 6 (Station 161+00 to Station 194+60)
 - a. Alternative 1 Levee Raise and Deep Cutoff Wall

A minimum 36-inch-wide, 115-foot-deep cutoff wall could be constructed (to elevation -75) in order to address both through seepage and steady-state underseepage issues in Reach 6. The levee would also need to be raised as much as eleven inches from Stations 173+58 to 194+60. Erosion issues in this Reach would be addressed by placing RSP along the waterside slope between Stations 165+00 and 195+00. All seven moderate-hazard and three high-hazard penetrations identified in the USACE inspections would need to be modified due to installation of the cutoff wall alternative in this Reach.

The USACE inspections also identified nine encroachments in this Reach as being unacceptable since they pose a high hazard to levee integrity. Two of the high hazard encroachments in the USACE inspections – a River Walk tower/sign and an apartment complex – will likely need to have an engineering assessment performed during future phases of the Flood Program in order to determine if they pose a threat to levee integrity, since it would be very expensive to remove these encroachments. The costs needed to remove/modify these encroachments are not included in this Report.

Other unacceptable, high-hazard encroachments in this Reach include utility poles, fences, and an access ramp that encroaches into the levee prism. These encroachments would be relocated or modified incidental to the construction of the cutoff wall.

This alternative would not likely require additional right-of-way since the levee footprint is not expected to change significantly.

The estimated cost for this alternative is approximately \$22.9 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

b. Alternative 2 – Levee Raise with a Seepage Berm

A 150-foot-wide seepage berm is another alternative that could address seepage and stability issues in Reach 6. The seepage berm width was based on a limited review of the existing explorations and evaluations in this levee segment, where a berm slightly wider than the minimum berm width may be required. However, due to the proximity of existing residential and municipal improvements to the existing landside levee toe in this Reach, this alternative was not considered feasible and was therefore not considered in this study.

7. Reach 7 (Station 194+60 to Station 199+60)

The I Street EIP Project is assumed to have addressed known deficiencies in this Reach. Additional geotechnical explorations and evaluations are needed to support this assumption.

- 8. Reach 8 (Station 199+60 to Station 215+30)
 - a. Alternative 1 Deep Cutoff Wall

A minimum 36-inch-wide, 115-foot-deep cutoff wall could be constructed (to elevation -75) in order to address through seepage and underseepage issues in Reach 8. In order to address erosion issues, RSP would be installed along the waterside toe in this Reach. All three of the moderate hazard penetrations within this segment would need to be modified due to installation of the cutoff wall. There are no other known penetrations in this Reach.

The USACE inspections also identified one high-hazard fire hydrant encroachment in this Reach. This Report considers the cost to relocate this fire hydrant, but since it is permitted by the CVFPB, it may be possible to provide information to USACE to give this encroachment an acceptable rating. This alternative would not likely require additional right-of-way since the levee footprint is not expected to change significantly.

The estimated cost for this alternative is approximately \$10.3 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

b. Alternative 2 – Seepage Berm

A 150-foot-wide seepage berm is another alternative that could address through seepage and underseepage issues in Reach 8. The seepage berm width was based on a limited review of the existing explorations and evaluations in this levee segment where a berm slightly wider than the minimum berm width may be required. However, due to the proximity of existing commercial improvements to the existing landside levee toe in this Reach, this alternative was not considered feasible and was, therefore, not considered in this study.

9. Reach 9 (Station 215+30 to Station 301+57)

Downstream of the Tower Bridge (Station 215+30), the Sacramento River West North "Levee" is more than 800 feet wide (this area is technically considered high ground by Wood Rodgers, even though it is treated by regulatory agencies as a levee). Between Stations 222+19 and 274+32, freeboard deficiencies range from six to sixteen inches. However, since the risk of levee failure due to overtopping is very low in this Reach, no freeboard improvements are proposed. Future analysis may eliminate identified freeboard deficiencies in this Reach. The only remaining deficiency is a waterside slope stability deficiency. To address this issue, the waterside slopes will be flattened to 2H:1V.

The USACE inspections identified 12 high-hazard penetrations and 15 high-hazard encroachments in this Reach. The USACE inspection requested additional information on these items so that these could be permitted. Future iterations of the Wood Rodgers 2016 Draft PIR may conduct additional exploration/evaluation of these penetrations and encroachments in order to assemble the documentation necessary for USACE inspections to reflect these items as acceptable. Therefore, physical modifications to these penetrations and encroachments is not expected to be needed as part of the Flood Program.

The estimated cost for this alternative is approximately \$10.8 million. If the oversteepened waterside slopes are allowed to remain and are addressed as maintenance items, these costs may be reduced.

B. Barge Canal Bulkhead Closure Structure

The concrete abutments adjacent to the Bulkhead would need to be raised approximately six inches in order to address freeboard deficiencies. Beyond the concrete abutments, a small embankment raise of six to twelve inches in height and twenty feet in width would be constructed away from the abutments for 200 to 300 feet until the new levee in this area ties into existing high ground. Alternatively, a concrete curb could be constructed.

In order to address the structural deficiencies, the individual plate girder assemblies will need to be retrofitted with a continuous 5/8-inch-thick steel plate. This new plate would be welded to the flanges on the Sacramento River side of the individual plate girder assemblies, and would overlap the existing continuous plate. The new plates would need to be 62 feet long and be centered on the individual plate girder assemblies. Due to the presence of the existing continuous tie plate, shim plates will be required for the addition of the 5/8-inch plate. All welds should be continuous between the plates. The existing plate girder assemblies will need to be removed to allow retrofit work to be completed out of the water in order to avoid issues that could arise from welding the old steel to new steel while the Bulkhead is under a load. As long as the retrofit work is completed in this manner, issues with welding old steel to new steel are not anticipated.

Finally, is recommended that the silt and debris at the base of the Bulkhead be removed in order to achieve the best seal possible along the base of the structure. With the Bulkhead properly seated, it is anticipated that the Bulkhead will seal much better; however a minor amount of water may still flow around the sides. Wood Rodgers feels that the seal between the Bulkhead and the abutments would improve with increased water levels since the weight of the water would "push" the Bulkhead firmly against the DWSC side of the abutment. These measures are not expected to make the Bulkhead watertight, but the minor leaking past the Bulkhead during a high water event is not expected to pose a hazard to the City.

The estimated costs of these improvements is approximately \$2.5 million. Due to uncertainty associated with these estimated costs, a 100-percent contingency was used.

- C. Sacramento River West South Levee
 - 1. Reach 1 (Station 0+00 to Station 295+00)

The Southport EIP Project currently in design will address known deficiencies in this Reach.

2. Reach 2 (Station 295+00 to Station 315+00)

Recent levee mitigation remediated deficiencies previously noted in this area. No improvements are necessary.

- 3. Reach 3 (Station 315+00 to Station 332+70)
 - a. Alternative 1 Minor Levee Raising

This Reach was found to have two localized areas with minor freeboard deficiencies. To address this deficiency, the levee would need to be raised approximately six inches between Stations 328+83 and 332+70. No other deficiencies were identified in this Reach. Due to the minor freeboard deficiency (and no other identified deficiencies), construction of an access road along the levee crown should address issues in this Reach.

This alternative would not likely require additional right-of-way since the levee footprint is not expected to change significantly. There are no known penetrations or encroachments in this Reach.

The estimated cost for this alternative is approximately \$3.4 million, which is primarily due to estimated land acquisition costs.

- D. Sacramento Bypass South Levee
 - 1. Reach 1 (Station 0+00 to Station 61+75)

The CHP Academy EIP project and levee improvements constructed under the USACE Contract B addressed many of the known deficiencies in this Reach. Although a ULDC geometry deficiency was identified in this Reach, it is assumed that this segment will quality for an exception due to the extensive review by DWR and USACE that occurred as part of the CHP Academy EIP Project.

The USACE inspections identified two high-hazard encroachments in this Reach. These were a pair of monitoring wells that were not shown in the CHP Academy EIP Record Drawings. The other encroachment was a toe cut on the west end of this Reach. A field visit was performed on February 24, 2016, and these encroachments could not be located. Therefore, physical modifications to these penetrations and encroachments is not expected to be needed as part of the Flood Program.

- 2. Reach 2 (Station 61+75 to Station 64+60)
 - a. Alternative 1 Deep Cutoff Wall with Waterside Slope Flattening

A minimum 36-inch-wide, 140-foot-deep cutoff wall could be constructed (to elevation -100) in order to address both through seepage and steady-state underseepage issues in Reach 2. The depth of the CHP Academy EIP cutoff wall at Station 61+75 is only elevation 5. Therefore, the new deep cutoff wall

would have to overlap the existing cutoff wall by approximately 200 feet (or more depending on future analyses) in order to mitigate end-around effects.

Additionally, although a ULDC geometry deficiency was identified in this Reach, it is assumed that this segment will qualify for an exception due to the extensive design review by USACE and DWR that occurred as part of the CHP Academy EIP Project. Therefore, geometry improvements are not proposed for this Reach. The existing waterside slope will be flattened and armored with concrete in order to address slope stability concerns in this Reach between Stations 61+75 and 63+50.

The USACE inspections identified three high-hazard and two moderate-hazard penetrations in this Reach. All five of these penetrations will need to be modified due to installation of the cutoff wall. There are no other known penetrations in this Reach. The USACE inspections also identified three moderate-hazard and six low-hazard encroachments in this Reach. These include monitoring wells, gates, and power poles. These will also be relocated or modified with construction of the cutoff wall in this Reach.

This alternative would require about 0.10 acre of additional right-of-way from the CHP Academy to accommodate the levee alignment shift due to the waterside slope flattening. This would also require the removal and replacement of the fence along the northern boundary of the CHP Academy.

The estimated cost for this alternative is approximately \$4.9 million. This alternative is considerably higher than Alternative 2, so it was not selected as the preferred mitigation measure in this Reach.

b. Alternative 2 – Seepage Berm with Waterside Slope Flattening

A 100-foot-wide seepage berm is another alternative that could address underseepage and stability issues in Reach 2. The seepage berm width was based on a limited review of the existing explorations and evaluations in this levee segment, where a berm slightly wider than the minimum berm width may be required. This seepage berm would overlap the existing CHP Academy cutoff wall by approximately 200 feet in order to mitigate end-around effects. The existing waterside slope would be flattened to 3H:1V and armored with concrete in order to address slope stability concerns in this Reach.

The USACE inspections identified three unacceptable penetrations since they may pose a high-hazard to levee integrity in this Reach. The USACE inspection requested additional information on these items so that these could be permitted. Future iterations of the Wood Rodgers 2016 Draft PIR may conduct additional exploration/evaluation of these encroachments in order to assemble the documentation necessary for USACE inspections to reflect these items as acceptable. Therefore, these encroachments are not considered to need modification with the seepage berm alternative in this Reach.

The USACE inspections also identified three moderate-hazard and six low-hazard encroachments in this Reach. These include monitoring wells, gates, and power poles. These will also be relocated or modified with construction of the seepage berm in this Reach.

This alternative requires approximately 0.8 acre of land to be acquired from the CHP Academy for the seepage berm footprint. The existing fence, utilities, and patrol road associated with the CHP Academy would also need to be removed and relocated to accommodate a seepage berm in this Reach.

The estimated cost for this alternative is approximately \$3.1 million. Due to the reduced costs, the seepage berm is the preferred remediation measure for this Reach. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

E. Training Berm

As previously discussed, although the Training Berm does not directly provide flood protection to the City, it appears to be important to direct flows from the Sacramento Bypass into the main channel of the Yolo Bypass, thereby protecting the Yolo Bypass East Levee south of the Sacramento Bypass. To address erosion and slope stability concerns with this berm, the slopes will be armored with RSP and flattened as needed (using RSP) to achieve a 3H:1V slope. Since the footprint is expected to change significantly, and adjacent land is within the Yolo and Sacramento Bypasses, land acquisition is not assumed to be needed for this berm. The estimated construction cost for this Reach is approximately \$9.7 million.

- F. Yolo Bypass East Levee
 - 1. Reach 1 (Station 0+00 to Station 27+52)
 - a. Alternative 1 Minor Levee Raise

To address minor freeboard deficiencies, the levee would need to be raised as much as six inches in this Reach. The waterside toe would be armored with RSP in order to address erosion concerns in this Reach. There is an acceptable/lowhazard penetration and two moderate hazard encroachments identified in this Reach. Future iterations of the Wood Rodgers 2016 Draft PIR may conduct additional exploration/evaluation of these encroachments in order to assemble the documentation necessary for USACE inspections to reflect the moderate hazard items as "acceptable". No other deficiencies were identified in this Reach. This alternative requires approximately 1.3 acres of land acquisition to accommodate a 20-foot future needs area along the landside toe of the levee. It appears an access road exists along the landside levee toe, so the required land acquisition may be reduced in future phases of the Flood Program.

The estimated cost for this alternative is approximately \$2.8 million.

- 2. Reach 2 (Station 27+52 to Station 51+63)
 - a. Alternative 1 Minor Levee Raise with Shallow Cutoff Wall

A minimum 36-inch-wide, 50-foot-deep cutoff wall could be constructed (to elevation -10) in order to address steady-state underseepage and landside slope stability issues in Reach 2. The levee would also need to be raised as much as six inches in this Reach. The waterside toe would be armored with RSP in order to address erosion concerns in this Reach.

The USACE inspections identified seven encroachments in this Reach, five of which included utility poles, fences, and debris on the levee slopes. These encroachments would be relocated or modified incidental to the construction of the cutoff wall. None of these encroachments were rated a high hazard. The other encroachments were access roads that did not encroach into the prism, so no modifications are proposed with this alternative. No penetrations were identified in this Reach.

This alternative requires approximately 1.4 acres of land acquisition to accommodate a 20-foot future needs area along the landside toe of the levee. It appears that an access road exists along the landside levee toe, so the required land acquisition may be reduced in future phases of the Flood Program.

The estimated cost for this alternative is approximately \$4 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

b. Alternative 2 – Minor Levee Raise with Seepage Berm

An 80-foot-wide seepage berm is another alternative that could be constructed to address underseepage and landside slope stability issues in this Reach. The seepage berm width was based on a limited review of the existing explorations and evaluations in this levee segment, where a minimum berm width seemed appropriate. However, due to the proximity of existing industrial buildings/ improvements at the existing landside levee toe in this Reach, this alternative was not considered feasible and was therefore not considered in this study.

- 3. Reach 3 (Station 51+63 to Station 70+00)
 - a. Alternative 1 Minor Levee Raise with Waterside Slope Reconstruction and Stability Berm

Reconstructing the waterside slope of the levee (similar to the USACE repair completed in 2009 as part of Contract C) from Stations 70+00 to 86+00 would address waterside slope stability issues in this Reach. The levee would also need to be raised as much as six inches and the waterside slope would be armored with RSP in order to address erosion concerns in this Reach.

The USACE inspections identified two high-hazard encroachments in this Reach, which include a drainage ditch and a storage area surrounded by barbed wire. These encroachments would be relocated or modified incidental to the construction of the improvements. No penetrations were identified in this Reach.

This alternative requires approximately 0.8 acre of land acquisition to accommodate a 20-foot future needs area along the landside toe of the levee. It appears that an access road exists along the landside levee toe, so the required land acquisition may be reduced in future phases of the Flood Program.

The estimated cost for this alternative is approximately \$7.2 million.

- 4. Reach 4 (Station 70+00 to Station 82+82)
 - a. Alternative 1 Minor Levee Raise

To address minor freeboard deficiencies, the levee would need to be raised as much as eight inches in this Reach (average raise is approximately four inches). The waterside toe would be armored with RSP in order to address erosion concerns.

The USACE inspections identified seven penetrations as being unacceptable since they pose a high hazard to levee integrity in this Reach. These items appear to be gas lines, or are associated with the existing pump station located just south of I-80. These penetrations do not appear to have positive closures.

All of these penetrations will need to be modified as part of the levee raising in this Reach.

This alternative requires approximately 0.6 acre of land acquisition to accommodate a 20-foot future needs area along the landside toe of the levee. It appears that an access road exists along the landside levee toe, so the required land acquisition may be reduced in future phases of the Flood Program.

The estimated cost for this alternative is approximately \$4.6 million.

- 5. Reach 5 (Station 82+82 to Station 95+50)
 - a. Alternative 1 Minor Levee Raise with Waterside and Landside Slope Reconstruction

The waterside and landside slopes of the Yolo Bypass East Levee need to be reconstructed in order to address slope stability issues in this Reach. Landside slope repairs should be similar to the landside slope repairs completed in 2011 by USACE as part of Contract D. Waterside reconstruction should be similar to the 2002 USACE Slump Repairs. The levee would also need to be raised as much as nine inches in this Reach (average raise is approximately four inches). The existing RSP would be extended to the new waterside hinge in order to match existing RSP extents.

One high-hazard penetration (30-inch steel pipeline) was identified in this Reach that will need to be modified to be above the 200-year water surface elevation. A positive closure device will also be added to this pipeline. Three high-hazard encroachments were also identified in this Reach. These encroachments include metal standpipes on the levee and utility poles. These will be relocated or modified incidental to the construction of the improvements in this Reach.

This alternative would require 6.4 acres of land acquisition along the landside toe to accommodate the drained toe berm, which extends approximately 30-feet beyond the existing landside toe in this Reach. The estimated cost for this alternative is approximately \$10.6 million.

- 6. Reach 6 (Station 95+50 to Station 114+50)
 - a. Alternative 1 Minor Levee Raise with Waterside Slope Reconstruction

The waterside slope of the Yolo Bypass East Levee needs to be reconstructed in order to address slope stability issues in this Reach. Waterside reconstruction should be similar to the 2002 USACE slump repairs. The levee would also need to be raised as much as eight inches in this Reach (average raise is approximately four inches). The existing RSP would be extended to the new waterside hinge in order to match existing RSP extents.

There were no high-hazard penetrations or encroachments identified in this Reach. One moderate-hazard encroachment (a sign) will be modified as part of the levee raising. The other moderate hazard encroachments (relief wells and monitoring wells) do not appear to be impacted by proposed improvements in this Reach and will therefore not be modified.

This alternative would require 0.9 acre of land acquisition along the landside toe to accommodate a future needs area.

The estimated cost for this alternative is approximately \$7.7 million.

- 7. Reach 7 (Station 114+50 to Station 130+00)
 - a. Alternative 1 Minor Levee Raise with Landside Slope Reconstruction

The landside slope of the Yolo Bypass East Levee needs to be reconstructed in order to address slope stability issues in this Reach. Landside slope repairs should be similar to the landside slope repairs completed in 2011 by USACE as part of Contract D. The levee would also need to be raised as much as nine inches in this Reach (average raise is approximately four inches). Rock slope protection would be continued to the proposed waterside hinge in order to match existing extents.

The USACE inspections identified one penetration as being unacceptable since it may pose a high hazard to levee integrity in this Reach. This penetration is associated with the existing pump station located just south of the UPRR tracks. This penetration does not appear to have positive closure devices. This penetration will need to be modified as part of the improvements in this Reach.

An existing fiber-optic line was found to be an unacceptable encroachment in this Reach. This line is located along the landside toe of the levee, so it will need to be modified as part of the landside slope reconstruction project.

This alternative would likely require 0.8 acres of additional right-of-way along the landside toe to accommodate the drained toe berm, which extends approximately 30 feet beyond the existing landside toe in this Reach.

The estimated cost for this alternative is approximately \$9.4 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

- 8. Reach 8 (Station 130+00 to Station 136+00)
 - a. Alternative 1 Minor Levee Raise with Waterside and Landside Slope Reconstruction

The waterside and landside slopes of the Yolo Bypass East Levee need to be reconstructed in order to address slope stability issues in this Reach. Landside slope repairs should be similar to the landside slope repairs completed in 2011 by USACE as part of Contract D. Waterside reconstruction should be similar to the 2002 USACE slump repairs. The levee would also need to be raised as much as nine inches in this Reach (average raise is approximately seven inches). Rock slope protection would be continued to the proposed waterside hinge in order to match existing extents.

The USACE inspections identified two encroachments in this Reach, which included an existing telephone cable conduit and a levee access ramp. These encroachments would be relocated or modified incidental to the construction of the improvements in this Reach. None of these encroachments were rated as high hazard. No penetrations were identified in this Reach.

This alternative would likely require additional right-of-way along the landside toe to accommodate the drained toe berm, which extends approximately 30 feet beyond the existing landside toe in this Reach. This alternative would also require the relocation of the existing drainage canal at the landside toe. A total of approximately one acre of land acquisition is needed to accommodate the improvements in this Reach.

The estimated cost for this alternative is approximately \$2.7 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

- 9. Reach 9 (Station 136+00 to Station 155+00)
 - a. Alternative 1 Levee Raise with Deep Cutoff Wall

A minimum 36-inch-wide, 95-foot-deep cutoff wall could be constructed (to elevation -55) in order to address steady-state underseepage issues in Reach 9. The levee would also need to be raised between 12 and 18 inches in this Reach.

Rock slope protection would be continued to the proposed waterside hinge in order to match existing extents.

The USACE inspections identified three penetrations in this Reach, all of which were identified as being unacceptable since they may pose a high hazard to levee integrity in this Reach. These penetrations will need to be modified due to construction of a cutoff wall in this Reach. There were no encroachments identified in this Reach.

This alternative would not likely require additional right-of-way since the levee footprint is not expected to change significantly. It is also assumed that RD 900 has access along the landside toe since the RD 900 drainage canal is located along the landside toe.

The estimated cost for this alternative is approximately \$10.6 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

b. Alternative 2 – Levee Raise with Seepage Berm

An 80-foot-wide seepage berm is another alternative that could be constructed to address underseepage issues in this Reach. The seepage berm width was based on a limited review of the existing explorations and evaluations in this levee segment, where a minimum berm width appeared appropriate. However, due to the proximity of an existing drainage canal to the existing landside levee toe in this Reach, the seepage berm may not address the gradient calculated at this ditch. For this reason, this alternative was not considered feasible and was therefore not considered in this study.

10. Reach 10 (Station 155+00 to Station 197+55)

a. Alternative 1 – Levee Raise

To address freeboard deficiencies, the levee would need to be raised between 12 and 18 inches in this Reach. Rock slope protection would be continued to the proposed waterside crown hinge in order to match existing extents.

There is one high-hazard fiber optic penetration identified in this Reach. No other information is available on this penetration. It is assumed that this penetration will need to be modified in this Reach. The USACE inspections also identified two monitoring wells as being high-hazard encroachments since abandonment/decommissioning was unknown. It is assumed that these will need to be abandoned as part of the levee raising in this Reach. No other deficiencies were identified in this Reach.

This alternative would not likely require additional right-of-way since the levee footprint is not expected to change significantly. It is also assumed RD 900 has access along the landside toe since the RD 900 drainage canal is located along the landside toe.

The estimated cost for this alternative is approximately \$1.7 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

G. South Cross Levee

- 1. Reach 1 (Station 0+00 to Station 65+00)
 - a. Alternative 1 Levee Raise with a Shallow Cutoff Wall

A minimum 36-inch-wide, 65-foot-deep cutoff wall could be constructed (to elevation -35) to address steady-state underseepage and landside slope stability issues in the South Cross Levee. Most of this levee would also need to be raised by an average of approximately 4.5 feet to provide adequate freeboard. Landside slope flattening would be accomplished by the levee raising. All four of the penetrations and seven encroachments within this segment would need to be modified due to installation of the cutoff wall. Finally, this alternative would require approximately 4.4 acres of residential and agriculture land to accommodate the increased levee footprint associated with the levee raising and a 20-foot future needs area.

The estimated cost for this alternative is approximately \$14.2 million. Despite being more expensive than Alternative 2, this alternative was selected as the preferred remediation measure in this Reach due to sensitivities associated with landside seepage berm improvements. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

b. Alternative 2 – Levee Raise with a Seepage Berm

An 80-foot-wide seepage berm could also be constructed to address underseepage and landside slope stability issues in the South Cross Levee. The seepage berm width was based on a limited review of the existing explorations and evaluations in this levee segment, where a minimum berm width appeared appropriate. Most of this levee would also need to be raised by an average of 4.5 feet to provide adequate freeboard. Landside slope flattening would be accomplished by the levee raising. All four of the penetrations and seven encroachments within this segment would need to be modified due to installation of the cutoff wall. This alternative would require approximately 17 acres of land acquisition in order to accommodate the seepage berm (including acquisition within residential parcels). Some existing improvements (pole barn) located on the western end of this Reach may need to be removed/relocated. One home located within the footprint of the seepage berm would need to be acquired.

The estimated cost for this alternative is approximately \$9.2 million. Due to sensitivities associated with improvements on the landside of the levee, this alternative was not selected as the preferred remediation measure in this Reach.

H. DWSC West Levee

- 1. Reach 1 (Station 0+00 to Station 35+00)
 - a. Alternative 1 –Levee Raise with Deep Cutoff Wall

A minimum 36-inch-wide, 100-foot-deep cutoff wall could be constructed (to elevation -60) in order to address both through seepage and steady-state underseepage issues in this Reach. The levee would also need to be raised by approximately 2.5 to 4 feet in this Reach. In order to address erosion potential, the upper 30 feet of the waterside slope would be armored with RSP, the lower slope would be seeded (with soil fill added for localized depressions), and a 50-foot-wide riparian corridor would be constructed waterward of the waterside toe. There were no penetrations or encroachments identified in this Reach.

Although the levee raising will increase the footprint of the "top" of the DWSC West Levee, the proposed improvements will be contained within the overall footprint of the DWSC West Levee. Therefore, additional right-of-way is not expected to be needed to accommodate the proposed levee raising.

The estimated cost for this alternative is approximately \$22.1 million. This may be reduced with channel-side borrow restrictions and additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

- 2. Reach 2 (Station 35+00 to Station 60+00)
 - a. Alternative 1 Levee Raise

To address freeboard deficiencies, the levee would need to be raised between 3.5 and 4 feet throughout this Reach. In order to address erosion potential, the upper 30 feet of the waterside slope would be armored with RSP, the lower slope would be seeded (with soil fill added for localized depressions), and a 50-foot-wide riparian corridor would be constructed waterward of the waterside toe. No other deficiencies were identified in this Reach.

Although the levee raising will increase the footprint of the "top" of the DWSC West Levee, the proposed improvements will be contained within the overall footprint of the DWSC West Levee. Therefore, additional right-of-way is not expected to be needed to accommodate the proposed levee raising.

A moderate hazard gas line along the landside toe was identified in this Reach. Since it is not a high hazard, modifications to this gas line will be addressed in a long-term plan in future phases of the Flood Program.

The estimated cost for this alternative is approximately \$4.5 million.

- 3. Reach 3 (Station 60+00 to Station 111+00)
 - a. Alternative 1 Levee Raise with Deep Cutoff Wall

A minimum 36-inch-wide, 95-foot-deep cutoff wall could be constructed (to elevation -60) in order to address underseepage issues in this Reach. The levee would also need to be raised by approximately 3.5 feet throughout this Reach. In order to address erosion potential, the upper 30 feet of the waterside slope would be armored with RSP, the lower slope would be seeded (with soil fill added for localized depressions), and a 50-foot wide riparian corridor would be constructed waterward of the waterside toe. There were no penetrations or encroachments identified in this Reach.

Although the levee raising will increase the footprint of the "top" of the DWSC West Levee, the proposed improvements will be contained within the overall footprint of the DWSC West Levee. Therefore, additional right-of-way is not expected to be needed to accommodate the proposed levee raising.

The estimated cost for this alternative is approximately \$28.8 million. This may be reduced with channel-side borrow restrictions and additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

- 4. Reach 4 (Station 111+00 to Station 145+00)
 - a. Alternative 1 Levee Raise

To address freeboard deficiencies, the levee would need to be raised by approximately 3.5 feet throughout this Reach. In order to address erosion potential, the upper 30 feet of the waterside slope would be armored with RSP, the lower slope would be seeded (with soil fill added for localized depressions), and a 50-foot-wide riparian corridor would be constructed waterward of the waterside toe. No other deficiencies were identified in this Reach.

Although the levee raising will increase the footprint of the "top" of the DWSC West Levee, the proposed improvements will be contained within the overall footprint of the DWSC West Levee. Therefore, additional right-of-way is not expected to be needed to accommodate the proposed levee raising.

The estimated cost for this alternative is approximately \$5.1 million.

- 5. Reach 5 (Station 145+00 to Station 165+00)
 - a. Alternative 1 Levee Raise with Shallow Cutoff Wall

A minimum 36-inch-wide, 65-foot-deep cutoff wall could be constructed (to elevation -30) in order to address underseepage issues in this Reach. The levee would also need to be raised by approximately 2.5 feet throughout this Reach. In order to address erosion potential, the upper 30 feet of the waterside slope would be armored with RSP, the lower slope would be seeded (with soil fill added for localized depressions), and a 50-foot wide riparian corridor would be constructed waterward of the waterside toe. There were no penetrations or encroachments identified in this Reach.

Although the levee raising will increase the footprint of the "top" of the DWSC West Levee, the proposed improvements will be contained within the overall footprint of the DWSC West Levee. Therefore, additional right-of-way is not expected to be needed to accommodate the proposed levee raising.

The estimated cost for this alternative is approximately \$5.7 million. This may be reduced with channel-side borrow restrictions and additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

- 6. Reach 6 (Station 165+00 to Station 202+00)
 - a. Alternative 1 Levee Raise

To address freeboard deficiencies, the levee would need to be raised by approximately three feet throughout this Reach. In order to address erosion potential, the upper 30 feet of the waterside slope would be armored with RSP, the lower slope would be seeded (with soil fill added for localized depressions), and a 50-foot-wide riparian corridor would be constructed waterward of the waterside toe. No other deficiencies were identified in this Reach.

Although the levee raising will increase the footprint of the "top" of the DWSC West Levee, the proposed improvements will be contained within the overall footprint of the DWSC West Levee. Therefore, additional right-of-way is not expected to be needed to accommodate the proposed levee raising.

The estimated cost for this alternative is approximately \$6 million.

- 7. Reach 7 (Station 202+00 to Station 290+00)
 - a. Alternative 1 Levee Raise with Embankment Reconstruction

Reconstructing the existing silty sand levee embankment using low permeability material is an alternative that could be constructed in order to address through seepage issues in this Reach with channel-side borrow restrictions to address underseepage issues. The levee would also need to be raised by approximately 2.5 to 3.5 feet throughout this Reach. In order to address erosion potential, the upper 30 feet of the waterside slope would be armored with RSP, the lower slope would be seeded (with soil fill added for localized depressions), and a 50-foot-wide riparian corridor would be constructed waterward of the waterside toe. There were no penetrations or encroachments identified in this Reach.

Although the levee raising will increase the footprint of the "top" of the DWSC West Levee, the proposed improvements will be contained within the overall footprint of the DWSC West Levee. Therefore, additional right-of-way is not expected to be needed to accommodate the proposed levee raising.

The estimated cost for this alternative is approximately \$15.9 million. Due to the increased costs with respect to Alternative 2, this was not selected as the preferred remediation measure in this Reach.

b. Alternative 2 – Levee Raise with Drained Stability Berm

A 10-foot-wide drained stability berm could be constructed in order to address through seepage and landside slope stability issues in this Reach. Channel-side borrow restrictions would also be required with this alternative to address steady-state underseepage deficiencies. The levee would also need to be raised by approximately 2.5 to 3.5 feet throughout this Reach. In order to address erosion potential, the upper 30 feet of the waterside slope would be armored with RSP, the lower slope would be seeded (with soil fill added for localized depressions), and a 50-foot-wide riparian corridor would be constructed waterward of the waterside toe. There were no penetrations or encroachments identified in this Reach.

Although the levee raising and stability berm will increase the footprint of the "top" of the DWSC West Levee, the proposed improvements will be contained within the overall footprint of the DWSC West Levee. Therefore, additional right-of-way is not needed to accommodate the proposed levee raising.

The estimated cost for this alternative is approximately \$15.6 million. This was selected as the preferred remediation measure in this Reach. However, the estimated costs may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

c. Alternative 3 – Levee Raise with a Deep Cutoff Wall

A minimum 36-inch-wide, 90-foot-deep cutoff wall could also be constructed (to elevation -55) in order to address through seepage, underseepage, and landside slope stability issues in this Reach. The levee would also need to be raised by approximately 2.5 feet throughout this Reach. In order to address erosion potential, the upper 30 feet of the waterside slope would be armored with RSP, the lower slope would be seeded (with soil fill added for localized depressions), and a 50-foot-wide riparian corridor would be constructed waterward of the waterside toe. There were no penetrations or encroachments identified in this Reach.

Although the levee raising will increase the footprint of the "top" of the DWSC West Levee, the proposed improvements will be contained within the overall footprint of the DWSC West Levee. Therefore, additional right-of-way is not expected to be needed to accommodate the proposed levee raising.

The estimated cost for this alternative is approximately \$47.6 million. Due to the increased costs with respect to Alternative 2, this was not selected as the preferred remediation measure in this Reach.

- 8. Reach 8 (Station 290+00 to Station 486+00)
 - a. Alternative 1 Levee Raise

To address freeboard deficiencies, the levee would need to be raised by approximately three to six feet throughout this Reach. In order to address erosion potential, the upper 30 feet of the waterside slope would be armored with RSP, the lower slope would be seeded (with soil fill added for localized depressions), and a 50-foot-wide riparian corridor would be constructed waterward of the waterside toe. No other deficiencies were identified in this Reach.

Although the levee raising will increase the footprint of the "top" of the DWSC West Levee, the proposed improvements will be contained within the overall footprint of the DWSC West Levee. Therefore, additional right-of-way is not expected to be needed to accommodate the proposed levee raising.

The estimated cost for this alternative is approximately \$36.9 million.

- 9. Reach 9 (Station 486+00 to Station 521+00)
 - a. Alternative 1 Levee Raise with Deep Cutoff Wall

A minimum 36-inch-wide, 95-foot-deep cutoff wall could be constructed (to elevation -60) in order to address steady-state underseepage issues in this Reach. The levee would also need to be raised by approximately three to four feet throughout this Reach. In order to address erosion potential, the upper 30 feet of the waterside slope would be armored with RSP, the lower slope would be seeded (with soil fill added for localized depressions), and a 50-foot-wide riparian corridor would be constructed waterward of the waterside toe. There were no penetrations or encroachments identified in this Reach.

Although the levee raising will increase the footprint of the "top" of the DWSC West Levee, the proposed improvements will be contained within the overall footprint of the DWSC West Levee. Therefore, additional right-of-way is not expected to be needed to accommodate the proposed levee raising.

The estimated cost for this alternative is approximately \$19.7 million. This may be reduced with channel-side borrow restrictions and additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

- 10. Reach 10 (Station 521+00 to Station 681+00)
 - a. Alternative 1 Levee Raise with Deep Cutoff Wall

A minimum 36-inch-wide, 110-foot-deep cutoff wall could be constructed (to elevation -80) in order to address possible through seepage issues and steady-state underseepage issues in this Reach. The levee would also need to be raised by approximately 2.5 to 3.5 feet throughout this Reach. In order to address erosion potential, the upper 30 feet of the waterside slope would be armored with RSP, the lower slope would be seeded (with soil fill added for localized depressions), and a 50-foot-wide riparian corridor would be constructed waterward of the waterside toe. There were no penetrations or encroachments identified in this Reach.

Although the levee raising will increase the footprint of the "top" of the DWSC West Levee, the proposed improvements will be contained within the overall footprint of the DWSC West Levee. Therefore, additional right-of-way is not expected to be needed to accommodate the proposed levee raising.

The estimated cost for this alternative is approximately \$102.7 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

- 11. Reach 11 (Station 681+00 to Station 705+00)
 - a. Alternative 1 Levee Raise with Shallow Cutoff Wall

A minimum 36-inch-wide, 25-foot-deep cutoff wall could be constructed (to elevation 5) in order to address through seepage issues in this Reach. The levee would also need to be raised by approximately one to two feet throughout this Reach. In order to address erosion potential, the upper 30 feet of the waterside slope would be armored with RSP, the lower slope would be seeded (with soil fill added for localized depressions), and a 50-foot-wide riparian corridor would be constructed waterward of the waterside toe. There were no penetrations or encroachments identified in this Reach.

Although the levee raising will increase the footprint of the "top" of the DWSC West Levee, the proposed improvements will be contained within the overall

footprint of the DWSC West Levee. Therefore, additional right-of-way is not expected to be needed to accommodate the proposed levee raising.

The estimated cost for this alternative is approximately \$4.9 million. Despite having increased costs with respect to Alternative 2, this was chosen as the preferred mitigation measure in this reach in order to maintain continuity with the cutoff walls in Reaches 10 and 12. The estimated costs may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

b. Alternative 2 – Levee Raise with Landside Drained Stability Berm

A 10-foot-wide drained stability berm could be constructed in order to address through seepage issues in this Reach. Landside borrow restrictions would also be required with this alternative to prevent steady-state underseepage deficiencies. The levee would also need to be raised by approximately one to two feet throughout this Reach. In order to address erosion potential, the upper 30 feet of the waterside slope would be armored with RSP, the lower slope would be seeded (with soil fill added for localized depressions), and a 50-foot-wide riparian corridor would be constructed waterward of the waterside toe. There were no penetrations or encroachments identified in this Reach.

Although the levee raising and stability berm will increase the footprint of the "top" of the DWSC West Levee, the proposed improvements will be contained within the overall footprint of the DWSC West Levee. Therefore, additional right-of-way is not expected to be needed to accommodate the proposed levee raising.

The estimated cost for this alternative is approximately \$4.1 million. As discussed above, this was not selected as the preferred remediation measure in this Reach.

- 12. Reach 12 (Station 705+00 to Station 720+00)
 - a. Alternative 1 Levee Raise with Shallow Cutoff Wall

A minimum 36-inch-wide, 40-foot-deep cutoff wall could be constructed (to elevation -10) in order to address through seepage issues in this Reach. Channel-side borrow restrictions would also be required with this alternative to address steady-state underseepage deficiencies. The levee would also need to be raised by up to one foot throughout this Reach. In order to address erosion potential, the upper 30 feet of the waterside slope would be armored with RSP, the lower slope would be seeded (with soil fill added for localized depressions),

and a 50-foot-wide riparian corridor would be constructed waterward of the waterside toe. There were no penetrations or encroachments identified in this Reach.

Although the levee raising will increase the footprint of the "top" of the DWSC West Levee, the proposed improvements will be contained within the overall footprint of the DWSC West Levee. Therefore, additional right-of-way is not expected to be needed to accommodate the proposed levee raising.

The estimated cost for this alternative is approximately \$3.9 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

- 13. Reach 13 (Station 720+00 to Station 1001+00)
 - a. Alternative 1 Levee Raise

To address freeboard deficiencies, the levee would need to be raised by approximately 1.5 to 2.5 feet throughout this Reach. In order to address erosion potential, the upper 30 feet of the waterside slope would be armored with RSP, the lower slope would be seeded (with soil fill added for localized depressions), and a 50-foot-wide riparian corridor would be constructed waterward of the waterside toe. No other deficiencies were identified in this Reach.

Although the levee raising will increase the footprint of the "top" of the DWSC West Levee, the proposed improvements will be contained within the overall footprint of the DWSC West Levee. Therefore, additional right-of-way is not expected to be needed to accommodate the proposed levee raising.

The estimated cost for this alternative is approximately \$41.5 million.

- I. DWSC East Levee
 - 1. Reach 1 (Station 0+00 to Station 8+00)

There were no freeboard, seepage, or erosion issues identified in this Reach. However, the USACE identified five high-hazard encroachments that need to be addressed. These encroachments were identified as being access ramps, a drainage ditch, and excavation near the landside toe of the levee which extends to the crown. To address these items, minor fill and slope reconstruction may be necessary. No additional right-of-way is needed to accommodate these repairs. Also, due to an existing RD 900 drainage canal located along the landside toe, and the DWSC along the waterside toe, no acquisition is expected to be needed for this Reach.

The estimated cost for this Reach is approximately \$85,000.

- 2. Reach 2 (Station 8+00 to Station 15+00)
 - a. Alternative 1 Deep Cutoff Wall with Waterside Slope Flattening

A minimum 36-inch-wide, 90-foot-deep cutoff wall could be constructed (to elevation -60) in order to address steady-state underseepage.in this Reach. Waterside slope stability issues were also identified in this Reach due to steep slopes associated with the pump station. Due to existing improvements at this location, slope flattening may not be feasible. Future phases of the Flood Program may include specific explorations and a geotechnical evaluation in the vicinity of the pump station to ensure slopes are stable as constructed.

Between Stations 13+72 and 14+72, RSP would be placed on the waterside slope to address erosion concerns.

The USACE inspections identified two penetrations in this Reach, one of which was rated as unacceptable since it may pose a high hazard to levee integrity. The other penetration appears to be related to the existing pump station near Station 12+50. Both of these penetrations will need to be modified to include positive closure devices with the construction of the cutoff wall.

Three high-hazard encroachments were also identified in this Reach. These pertained to the existing pump Station (i.e.: drainage basin, concrete walls, and fences). These items would either be inspected as part of the cutoff wall improvements and permitted with USACE, or modified if they were found to be a threat to the levee. Eight other encroachments were identified in this Reach that were a moderate hazard. These included access ramps, fences, gates, and signs. All of these encroachments would be modified as part of the cutoff wall improvements.

This alternative would not likely require additional right-of-way since the levee footprint is not expected to change significantly.

The estimated cost for this alternative is approximately \$3.6 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

b. Alternative 2 – Seepage Berm with Waterside Slope Flattening

An 80-foot-wide seepage berm with waterside slope flattening is another alternative that could be constructed to address steady-state underseepage and

waterside rapid drawdown slope stability issues in this Reach. However, due to the proximity of an existing drainage canal to the existing landside levee toe in this Reach, this alternative is not considered feasible and was therefore not considered in this study.

- 3. Reach 3 (Station 15+00 to Station 85+55)
 - a. Alternative 1 Deep Cutoff Wall

A minimum 36-inch-wide, 140-foot-deep cutoff wall could be constructed (to elevation -110) in order to address steady-state underseepage seepage issues in this Reach. Also, due to an existing RD 900 drainage canal located along the landside toe, and the DWSE along the waterside toe, no acquisition is expected to be needed for this Reach.

The USACE inspections identified three high-hazard encroachments in this Reach. These were all access ramps that cut into the levee prism. These ramps would be reconstructed to be outside of the levee prism with the construction of the cutoff wall.

Three high-hazard encroachments were also identified in this Reach. These pertained to the exiting pump station (i.e.: drainage basin, concrete walls, and fences). These items would either be inspected as part of the cutoff wall improvements and permitted with USACE, or modified if they were found to be a threat to the levee. Ten other encroachments were identified in this Reach that were a moderate hazard. These included access ramps, fences, gates, and signs. All of these encroachments would be modified as part of the cutoff wall improvements. There were no penetrations identified in this Reach.

The estimated cost for this alternative is approximately \$45.3 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

b. Alternative 2 – Seepage Berm

An 80-foot-wide seepage berm is another alternative that could be constructed to address steady-state underseepage issues in this Reach. However, due to the proximity of an existing drainage canal and existing homes to the existing landside levee toe in this Reach, this alternative was not considered feasible and was therefore not considered in this study.

- 4. Reach 4 (Station 85+55 to Station 102+00)
 - a. Alternative 1 Shallow Cutoff Wall

A minimum 36-inch-wide, 60-foot-deep cutoff wall could be constructed (to elevation -30) in order to address steady-state underseepage issues in this Reach. Also, due to an existing RD 900 drainage canal located along the landside toe, and the Yolo Bypass along the waterside toe, no acquisition is expected to be needed for this Reach.

One high-hazard encroachment was found in this Reach: debris on the levee slope. The debris would be removed as part of the cutoff wall project. There were also seven moderate-hazard encroachments in this Reach that included access ramps, signs, and posts within the levee prism. These would be modified due to the construction of the cutoff wall in order to reduce the threat to levee integrity posed by these items.

The estimated cost for this alternative is approximately \$2.8 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

b. Alternative 2 – Seepage Berm

An 80-foot-wide seepage berm is another alternative that could be constructed to address steady-state underseepage issues in this Reach. However, due to the proximity of an existing drainage canal to the existing landside levee toe in this Reach, this alternative is not considered feasible and was therefore not considered in this study.

- 5. Reach 5 (Station 102+00 to Station 106+00)
 - a. Alternative 1 Shallow Cutoff Wall

A minimum 36-inch-wide, 60-foot-deep cutoff wall could be constructed (to elevation -30) in order to address steady-state underseepage issues in this Reach. Both waterside and landside slope stability issues were also identified in this Reach due to steep slopes associated with the pump station. Due to existing improvements at this location, slope flattening may not be feasible. Future phases of the Flood Program may include specific explorations in the vicinity of the pump station to ensure slopes are stable as constructed. Also, due to an existing RD 900 drainage canal located along the landside toe, and the Yolo Bypass along the waterside toe, no acquisition is expected to be needed for this Reach.

The USACE inspections identified three unacceptable penetrations in this Reach since it may pose a high hazard to levee integrity. One moderate-hazard penetration was also identified. These were related to the pump station penetrations located near Station 104+00. The pump station penetrations will be modified to include positive closure devices and the pipelines will be raised above the DWSE as part of the cutoff wall improvements. The pump station structure was also identified as a high-hazard encroachment in this Reach. Modifications to the pump station facility are not anticipated with construction of the cutoff wall. Future phases of the Flood Program may conduct an inspection of this facility to demonstrate it does not pose an unacceptable risk to levee integrity since relocation/reconstruction of the pump station would significantly increase remediation costs.

The estimated cost for this alternative is approximately \$3.8 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

b. Alternative 2 – Seepage Berm with Waterside Slope Flattening

An 80-foot-wide seepage berm with waterside slope flattening is another alternative that could be constructed to address steady-state underseepage, landside slope stability, and waterside rapid drawdown stability issues in this Reach. However, due to the proximity of an existing drainage canal and existing improvements at the existing landside levee toe in this Reach, this alternative was not considered feasible and was therefore not considered in this study.

- 6. Reach 6 (Station 106+00 to Station 145+00)
 - a. Alternative 1 Shallow Cutoff Wall

A minimum 36-inch-wide, 60-foot-deep cutoff wall could be constructed (to elevation -30) in order to address steady-state underseepage issues in this Reach. Also, due to an existing RD 900 drainage canal located along the landside toe, and the Yolo Bypass along the waterside toe, no acquisition is expected to be needed for this Reach.

Two high-hazard fence encroachments were identified in this Reach. One is a residence located near Station 130+00, and the other is a barbed wire fence near Station 138+00. There were no penetrations identified in this Reach.

The estimated cost for this alternative is approximately \$9.5 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

b. Alternative 2 – Seepage Berm

An 80-foot-wide seepage berm is another alternative that could be constructed to address steady-state underseepage issues in this Reach. However, due to proximity of an existing drainage canal to the existing landside levee toe in this Reach, this alternative was not considered feasible and was therefore not considered in this study.

J. Port North Levee

The Port North area is heavily developed with industrial and maritime-related improvements. These improvements pose a significant challenge to developing a preferred flood control alignment without significantly impacting Port operations. The alignment used in this AAR was developed to eliminate "splitting" of the Port, leaving facilities waterward of the levee protection. Since a clear alignment could not be developed along the turning basin and the Port from Stations 135+00 to 235+00, the proposed alignment generally follows the USACE alignment along Industrial Boulevard. This would result in most of the existing facilities in the Port being waterward of the levee alignment. Furthermore, the alternatives proposed for this levee segment would likely require extensive utility research/investigation as well as coordination with existing property and business owners in order to determine the feasibility of implementing the alternatives presented in this section.

The City is pursuing an alternative to construct a closure structure across the Deep Water Ship Channel south of the Port, primarily due to these concerns. This is discussed in more detail in Section VIII of this AAR.

1. Reach 1 (Station 0+00 to Station 8+00)

There were no freeboard, seepage, stability or erosion issues identified in this Reach. No remediation is necessary.

- 2. Reach 2 (Station 8+00 to Station 26+00)
 - a. Alternative 1 Minor Levee Raise with Shallow Cutoff Wall

A minimum 36-inch-wide, 25-foot-deep cutoff wall could be constructed (to elevation zero) in order to address possible nuisance seepage issues in this Reach. The identified potential "nuisance" seepage may result in ongoing maintenance during and following high water events. To address freeboard deficiencies, the levee would need to be raised an average of approximately six inches.

The levee raising will increase the levee footprint width to the landside by five feet or less. There do not appear to be any buildings or structures that would be impacted by widening (an existing paved parking area is approximately 50 feet from the current landside toe), although an additional 2.7 acres of right-of-way would need to be secured to accommodate the increased width and a future needs area along the landside and waterside slopes.

The estimated cost for this alternative is approximately \$2.1 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

- 3. Reach 3 (Station 26+00 to Station 35+50)
 - a. Alternative 1 Levee Raise with Waterside Slope Flattening

To address freeboard deficiencies, the levee would need to be raised an average of approximately one foot throughout this Reach. The waterside slope would be flattened to 3H:1V to address waterside rapid drawdown slope stability issues in this Reach.

The levee raising will increase the levee footprint width by approximately six feet. Agrium US, Inc. (Agrium) is a fertilizer production company located in this Reach, and raising the levee through the Agrium property would require modification of ramps and structures that span across the levee. A paved parking area would also be impacted. It is likely that Agrium business operations would be severely impacted by the improvements. Due to the many unknown impacts, an increased contingency of 50 percent was used in this Reach. An approximately 0.6 acre of land acquisition is needed for these improvements.

The estimated cost for this alternative is approximately \$1.7 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

- 4. Reach 4 (Station 35+50 to Station 45+00)
 - a. Alternative 1 Levee Raise with Shallow Cutoff Wall

A minimum 36-inch-wide, 25-foot-deep cutoff wall could be constructed (to elevation zero) in order to address possible nuisance seepage issues in this Reach. The identified potential "nuisance" seepage may result in ongoing maintenance during and following high water events. To address freeboard

deficiencies, the levee would need to be raised an average of approximately one foot throughout this Reach.

The levee raising will increase the levee footprint width by approximately six feet. There do not appear to be any buildings or structures that would be impacted by widening, although 1.1 acres of land acquisition is needed from the Port for these improvements plus an additional 20 feet along the landside slope for a future needs area.

The estimated cost for this alternative is approximately \$1.1 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

- 5. Reach 5 (Station 45+00 to Station 54+00)
 - a. Alternative 1 Minor Levee Raise with Shallow Cutoff Wall

A minimum 36-inch-wide, 25-foot-deep cutoff wall could be constructed (to elevation zero) in order to address possible nuisance seepage issues in this Reach. The identified potential "nuisance" seepage may result in ongoing maintenance during and following high water events. To address freeboard deficiencies, the levee would need to be raised an average of approximately six inches. The levee raise would extend waterward of existing industrial improvements, which are built up to the existing levee crown.

An existing industrial development with a paved parking and storage area would be impacted by the proposed levee raising and cutoff wall, and approximately 1.2 acres of land would need to be acquired from the property owner and/or the Port to accommodate the proposed improvements and future needs area. Due to increased coordination with the adjacent industrial development, an increased contingency of 50 percent was applied in this Reach.

The estimated cost for this alternative is approximately \$1.4 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

- 6. Reach 6 (Station 54+00 to Station 163+00)
 - a. Alternative 1 Levee Raise with Shallow Cutoff Wall

A minimum 36-inch-wide, 25-foot-deep cutoff wall could be constructed (to elevation zero) in order to address possible nuisance seepage issues in this Reach. The identified potential "nuisance" seepage may result in ongoing

maintenance during and following high water events. To address freeboard deficiencies, the levee would need to be raised an average of approximately three feet.

The levee raising will increase the levee footprint width by approximately 15 feet. A Cemex plant is located between Stations 70+00 and 82+00 in this Reach. Raising the levee in this Reach would require close coordination with Cemex to minimize impacts to Cemex's operations. Additionally, the levee would be constructed of fill placed along existing railroad tracks between Stations 125+00 and 134+00. This fill would be on the waterside of the existing levee due to construction conflicts with the existing railroad and Industrial Boulevard. Although the waterside has the potential to introduce hydraulic impacts, as the turning basin is not a conveyance facility, it is likely that the hydraulic impacts are minimal and acceptable. A closure structure would be installed across Boathouse Road near Station 155+70. This alternative would require approximately 25 acres of land acquisition from the Port to accommodate the improvements. Due to the many unknown impacts, an increased contingency of 50 percent was used in this Reach.

Due to the varying geometry of the proposed improvements, a cross section was not created for this Reach. Estimated quantities were developed by estimating the amount of fill needed to construct a new levee with an average height of three feet above existing grade. The working platform for the shallow cutoff wall was assumed to be the existing ground elevation.

The estimated cost for this alternative is approximately \$21.2 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

- 7. Reach 7 (Station 163+00 to Station 236+00)
 - a. Alternative 1 Floodwall with Shallow Cutoff Wall

A minimum 36-inch-wide, 25-foot-deep cutoff wall could be constructed (to elevation zero) in order to address nuisance seepage issues in this Reach. The identified potential for "nuisance" seepage may result in ongoing maintenance during and following high water events, and may detrimentally impact the levee with successive seepage immediately under the levee and exiting at or near the levee toe. To address freeboard deficiencies, a floodwall with an average height of approximately three feet above existing grade would be constructed in this Reach.

The alignment for this alternative follows the USACE GRR alignment along Industrial Boulevard. However, it is noted that different alignments are not expected to significantly change the estimated costs.

This alternative may require demolition of buildings owned/operated by SSA Marine between Stations 165+00 and 175+00. Demolition of these and other buildings near the alignment are included in the cost estimates for this alternative.

Closure structures would be constructed at Harbor Boulevard and Terminal Street. A closure would be also be required across existing railroad tracks. East of Industrial Boulevard, the floodwall and cutoff wall would be constructed waterward of the existing railroad tracks.

Reach 7 is the most challenging Reach for constructing improvements in the Port North area. This alternative would require approximately 6.7 acres of land acquisition from the Port to accommodate the improvements. Due to the many unknown impacts, an increased contingency of 50 percent was used in this Reach.

Due to the varying geometry of the proposed improvements, a cross section was not created for this Reach. Estimated quantities were developed by estimating the concrete and reinforcing steel in a typical floodwall, using the dimensions shown on Figure 14. Asphalt removal and replacement was estimated using aerial imagery. The working platform for the shallow cutoff wall was assumed to be the existing ground elevation.

The estimated cost for this alternative is approximately \$20.9 million. This may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

8. Reach 8 (Station 236+00 to Station 244+00)

There were no freeboard, seepage, stability, or erosion issues identified in this Reach. No remediation measures are needed in this Reach.

K. Port South Levee

- 1. Reach 1 (Station 0+00 to Station 23+00)
 - a. Alternative 1 Levee Raise

To address freeboard deficiencies, the levee would need to be raised an average of approximately 18 inches throughout this Reach. No other deficiencies were identified in this Reach.

The levee raising will increase the levee footprint width by approximately 10 feet. There do not appear to be any buildings or structures that would be impacted by widening (existing structures are more than 100 feet from the landside toe), although an additional 6.9 acres of right-of-way would need to be secured to accommodate the increased width and future needs areas.

The estimated cost for this alternative is approximately \$1.7 million.

- 2. Reach 2 (Station 23+00 to Station 116+00)
 - a. Alternative 1 Levee Raise with Deep Cutoff Wall

A minimum 36-inch-wide, 120-foot-deep cutoff wall could be constructed (to elevation -95) in order to address steady-state underseepage issues in this Reach. This wall would have to extend 200 feet beyond the ends of this Reach to address end-around effects. For freeboard deficiencies, the levee would need to be raised an average of approximately 18 inches. No other deficiencies were identified in this Reach.

The levee raising will increase the levee footprint width by approximately 10 feet. There is an existing storage tank near Station 26+50 that is approximately 25 feet from the landside levee toe. The fence around this tank is approximately 13 feet from the levee toe and may need to be relocated to accommodate the levee widening. However, it may be possible to address freeboard deficiencies in this area by shifting the levee alignment slightly waterward in order to avoid conflict these facilities. Other than this structure, there do not appear to be any buildings or structures that would be impacted by the widening, although an additional 28.9 acres of right-of-way would need to be secured to accommodate the increased width and a future needs area along the landside and waterside slopes.

The estimated cost for this alternative is approximately \$53.5 million. Due to the increased costs with respect to Alternative 2, this was not selected as the preferred remediation measure in this Reach.

b. Alternative 2 – Levee Raise with a Seepage Berm

A 45-foot-wide seepage berm is another option that could be constructed in order to address steady-state underseepage issues in this Reach. This berm would have to extend 200 feet beyond the ends of this Reach to address end-around effects. To address freeboard deficiencies, the levee would need to be raised an average of approximately 18 inches. No other deficiencies were identified in this Reach.

The seepage berm would impact an existing storage tank near Station 26+50 that is approximately 25 feet from the landside levee toe. Other than this structure, there do not appear to be any buildings or structures that would be impacted by the seepage berm, although an additional 40.3 acres of right-of-way would need to be secured to accommodate the increased width and a future needs area along the landside and waterside slopes.

The estimated cost for this alternative is approximately \$29.1 million. This was selected as the preferred remediation measure in this Reach. However, the estimated costs may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

- 3. Reach 3 (Station 116+00 to Station 118+00)
 - a. Alternative 1 Levee Raise

To address freeboard deficiencies, the levee would need to be raised an average of approximately 18 inches throughout this Reach. No other deficiencies were identified in this Reach. Due to the relatively short length, underseepage mitigation measures in Reaches 2 and 4 will extend significantly into this Reach.

The estimated cost for this alternative is approximately \$732,000.

- 4. Reach 4 (Station 118+00 to Station 123+50)
 - a. Alternative 1 Levee Raise with a Shallow Cutoff Wall

A minimum 36-inch-wide, 45-foot-deep cutoff wall could be constructed (to elevation -20) in order to address steady-state underseepage issues in this Reach. To address freeboard deficiencies, the levee would need to be raised an

average of approximately one foot. No other deficiencies were identified in this Reach.

The levee raising will increase the levee footprint width by approximately six feet. There do not appear to be any buildings or structures that would be impacted by the widening, although an additional 2.3 acres of right-of-way would need to be secured to accommodate the increased width and a future needs area along the landside and waterside slopes.

The estimated cost for this alternative is approximately \$940,000. Although this alternative is less expensive than Alternative 2, it was not chosen as the preferred remediation measure since it breaks continuity with the seepage berm from Reach 2 (which spans much of Reach 3 due to its small length).

b. Alternative 2 – Levee Raise with a Seepage Berm

A 50-foot-wide seepage berm is another option that could be constructed in order to address steady-state underseepage issues in this Reach. To address freeboard deficiencies, the levee would need to be raised an average of approximately one foot. No other deficiencies were identified in this Reach.

There do not appear to be any buildings or structures that would be impacted by the seepage berm, although an additional 3.4 acres of right-of-way would need to be secured to accommodate the increased width and a future needs area along the landside and waterside slopes.

The estimated cost for this alternative is approximately \$2.2 million. Although this is more expensive than Alternative 1, this is the preferred remediation measure for this Reach since it allows continuity with the seepage berm from Reach 2 (which spans Reach 3 due to its small length). These costs may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

- 5. Reach 5 (Station 123+50 to Station 138+00)
 - a. Alternative 1 Levee Raise

To address freeboard deficiencies, the levee would need to be raised an average of approximately 18 inches throughout this Reach, although the maximum raising is nearly five feet. No other deficiencies were identified in this Reach.

The levee raising will increase the levee footprint width by approximately 10 feet. There do not appear to be any buildings or structures that would be

impacted by with widening (existing structures are more than 100 feet from the landside toe), although an additional 4.8 acres of right-of-way would need to be secured to accommodate the increased width and a future needs area along the landside and waterside slopes.

The estimated cost for this Reach is approximately \$2 million.

- 6. Reach 6 (Station 138+00 to Station 143+00)
 - a. Alternative 1 Levee Raise with Waterside Slope Flattening

To address freeboard deficiencies, the levee would need to be raised an average of approximately one foot throughout this Reach. The waterside slope would also need to be flattened to 3H:1V in order to address waterside rapid drawdown slope stability issues.

The levee raising will increase the levee footprint width by approximately six feet. There do not appear to be any buildings or structures that would be impacted by the widening, although an additional 1.1 acres of right-of-way would need to be secured for the increased width and landside future needs area.

The estimated cost for this Reach is approximately \$585,000. These costs may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

- 7. Reach 7 (Station 143+00 to Station 186+93)
 - a. Alternative 1 Levee Raise with a Shallow Cutoff Wall

A minimum 36-inch-wide, 25-foot-deep cutoff wall could be constructed (to elevation zero) in order to address nuisance seepage issues in this Reach. The identified potential "nuisance" seepage may result in ongoing maintenance during and following high water events. Additionally, the waterside slope would also be flattened to 3H:1V in order to address waterside rapid drawdown slope stability issues though Station 158+00. To address freeboard deficiencies, the levee would need to be raised by more than four feet. No other deficiencies were identified in this Reach.

The levee raising will increase the levee footprint width by approximately 25 feet. There do not appear to be any buildings or structures that would be impacted by the widening, although an additional 8.2 acres of right-of-way would need to be secured to accommodate the increased width and a future needs area along the landside and waterside slopes.

The estimated cost for this alternative is approximately \$6.2 million. These costs may be reduced with additional geotechnical exploration and evaluation, as discussed in Section VIII of this Report.

VII. DESCRIPTION OF THE PREFERRED PLAN

The preferred remediation measure for each Reach is highlighted in bold on Table 4. **Table 5** (attached) presents the estimated costs of the recommended remediation measures in each reach against costs for remediation measures included in previous evaluation efforts. The recommended remediation measures are also shown graphically on **Figure 18** (attached). The preferred remediation measures would require approximately 2.3 million cubic yards of borrow material, as shown in **Table 6** (attached).

The Sacramento River West North Levee would be improved with a combination of shallow and deep cutoff walls, slope flattening, and stability berms. The levee would be raised in localized areas where freeboard was found to be deficient. Rock slope protection would be placed on the waterside slope downstream of the confluence with the American River down to the Tower Bridge.

The Sacramento River West South Levee was found to have a small segment of freeboard deficiency along the Barge Canal. This segment would be raised up to six inches. The Southport EIP project will address other known deficiencies in this levee.

The Sacramento Bypass South Levee would be improved with a seepage berm and waterside slope flattening just downstream of the Sacramento Weir, and rock slope protection would be placed on both sides of the Training Berm to address erosion potential.

The Yolo Bypass East Levee would be raised by up to 18 inches between the Sacramento Bypass and the UPRR tracks. Downstream of the UPRR tracks, the Yolo Bypass East Levee needs to be raised up to six inches. Other improvements in this levee include deep and shallow cutoff walls, waterside and landside slope flattening, and stability berms. Rock slope protection would be placed along this entire levee segment.

The South Cross Levee would be raised several feet, and a shallow cutoff wall would be constructed in order to address identified deficiencies in this levee.

The DWSC West Levee would be improved with deep and shallow cutoff walls and stability berms. The levee would also generally be raised between 2.0 and 3.5 feet. In order to address erosion potential, the upper 30 feet of the waterside slope would be armored with RSP, the lower slope would be seeded (with soil fill added for localized depressions), and a 50-foot-wide riparian corridor would be constructed waterward of the waterside toe of the entire levee. These improvements would be coupled with channel-side borrow restrictions.

The DWSC East Levee would be improved with deep and shallow cutoff walls. Rock slope protection would be placed just south of the Port to address erosion issues identified in this Reach.

The Port North Levee improvements would consist of levee raising, floodwalls, shallow cutoff walls (due to seepage issue resulting from levee raises). The Port South would be improved with raised levees, seepage berms, and waterside slope flattening.

The total estimated cost to plan, permit, design, and construct these improvements is approximately \$635 million. Table 3 also presents the costs of "minimum remediation measures" where these may be supported by additional exploration, evaluation, and/or using updated data. Opportunities to reduce the extent of some of the recommended mitigation measures is discussed in the following section.

VIII. POTENTIAL ACTIONS TO REDUCE SELECTED PLAN COSTS

Wood Rodgers' 2016 PIR was developed using information developed by and contained in previous studies. Where information was incomplete or uncertainties existed, conservative assumptions were made in order to identify deficiencies and recommend mitigation measures. Performing additional geotechnical explorations and analysis or using updated hydrologic data in order to establish a lower DWSE has the potential to reduce estimated Flood Program costs. Furthermore, although construction of a closure structure across the DWSC may increase remediation measures for the DWSC East Levee, this project could also eliminate significant remediation measures required at the Port North, Port South, and DWSC West Levees. The potential remediation measure reductions associated with this potential action are discussed in this section.

A. DWSE Reductions

Freeboard deficiencies were identified using a DWSE that incorporated the USACE Comprehensive Study (Comp Study) hydrology. Over the past several years, DWR and USACE have developed updated hydrology as part of the Central Valley Hydrology Study (CVHS). Although a detailed comparison of the DWSE using Comp Study hydrology vs. CHVS hydrology was not performed for this AAR, qualitative assessments by Wood Rodgers and others suggest that design water surfaces computed using the updated CVHS hydrology are generally lower than those developed using earlier Comp Study hydrology.

If the DWSE was developed using the CVHS hydrology, it is likely that the DWSE could be lowered by as much as one foot in many of the waterways around the City. Although this reduction is not expected to reduce recommended geotechnical remediation measures, it does have the potential to reduce the extent of freeboard improvements, particularly in areas where minor levee raises (i.e., raises less than six inches) are needed.

B. Additional Subsurface Explorations and Geotechnical Evaluation

The geotechnical deficiencies identified were based on a review of available information. If additional geotechnical explorations and analyses are conducted, it may be possible to reduce the estimated remediation costs, as shown in Table 3.

C. DWSC Closure Structure Option

The City is in the process of evaluating the feasibility of constructing a closure structure across the DWSC. The preliminary array of closure structure alternatives includes permanent closures (i.e., earthen levee across the DWSC) and operable closures (i.e., sector gates, lift gates, barge gates and others). The closure structure evaluation is ongoing, but preliminary cost estimates range from approximately \$76 million dollars for an earthen levee closure to approximately \$365 million for an operable sector gate closure.

A closure across the DWSC could eliminate the need to improve the Port North and Port South levees. It would also greatly reduce the extent of improvements needed to the DWSC West Levee south of the closure. The total length of levees that could potentially be eliminated by constructing a closure structure is approximately 27 miles, or approximately 56 percent of the WSLIP levee system. However, this option would require additional improvements to the DWSC East Levee in order to provide 200-year flood protection based on the DWSE in the Yolo Bypass.

IX. CONCLUSIONS AND RECOMMENDATIONS

This AAR presents the recommended alternatives to mitigate the deficiencies identified in the Wood Rodgers Draft 2016 PIR. These improvements represent the baseline improvements that are needed in order to provide 200-year flood protection to the City. The total estimated cost to plan, permit, design, and construct these improvements is approximately \$635 million.

As noted in the previous section, conducting additional explorations or using the latest hydrologic models has the potential to reduce the estimated cost of the baseline improvements to approximately \$338 million.

It is recommended that the analysis and preliminary cost estimates developed within this AAR document be used for development of the City's official Flood Program Baseline Program Cost Estimate for a finding of adequate progress in 2016 with respect to ULOP Criteria. It is also recommended that the City consider pursuing additional explorations, evaluation, and the use of updated hydrologic and hydraulic data in order to reduce the estimated Baseline Flood Program Costs.

28	CSM	110'	30'	n/a ³	\$150,000 to \$200,000									
	One Pass Trench (Dewind)	85'	25'	\$7.00 to \$12.00	\$75,000 to \$125,000									
	Jet Grout	200'+	25'	\$75.00 to \$150.00	\$250,000 to \$500,000									
СВ	Conventional	85'	20' ²	\$20.00 to \$30.00	\$75,000 to \$125,000									

NOTE: Other site-specific conditions and specification requirements can have a significant influence on costs

For Conventional Construction the levee must be degraded at least 1/3 of the height due to geotechnical

¹. stability issues.

Conventional Construciton of CB Cutoff Wall does not require a 1/3 degrade. The strength of the Cement-

2. Bentonite fill mitigates stability concerns.

3. Limited or missing data

Mr. Jonathan Kors Wood Rodgers, Inc. 3301 C Street, Bldg. 100-B Sacramento, CA 95816

Subject: **City of West Sacramento Flood Program Engineering Services Geotechnical Alternatives Analysis Report** West Sacramento, California

Dear Mr. Kors,

Blackburn Consulting (BCI) is pleased to submit this Geotechnical Alternatives Analysis Report (GAAR) for the City of West Sacramento Flood Program Engineering Services. This GAAR provides a summary of geotechnical alternatives for the levee system surrounding West Sacramento based on the identified geotechnical deficiencies as summarized in BCI's Geotechnical Problem Identification Report.

Thank you for including BCI on your team for this important project. Please call if you have questions or require additional information.

Sincerely,

BLACKBURN CONSULTING Robert B. Lokteff, P.E., G.E

Principal

Nicole C. Hart, P.E. **Project Manager**

Figure 3 - BCI Geotechnical Deficiencies

1. PURPOSE

Blackburn Consulting (BCI) prepared this Geotechnical Alternatives Analysis Report (GAAR) report for Wood Rodgers, Inc. (WR) as part of their overall alternatives analysis evaluation of the West Sacramento flood control system.

2. SCOPE OF SERVICES

BCI performed the following to prepare this GAAR:

- Reviewed existing available geotechnical alternatives analyses performed by others for the West Sacramento levee system. Section 4 of this report contains a list of the documents reviewed.
- Reviewed recent West Sacramento levee improvement design reports and plans.
- Considered the BCI May 2016 Geotechnical Problem Identification Report (GPIR) prepared for the West Sacramento Levee System.
- Evaluated:
 - Relevant West Sacramento geology, geomorphology, historical levee construction methods and failures discussed in the existing levee deficiency evaluations.
 - Subsurface profiles, number and spacing of subsurface explorations, design water surfaces, geotechnical parameters, electromagnetic imaging, levee geometry (provided by WR) and results from the cross-sections previously analyzed in the existing levee deficiency evaluations.
 - Topographic mapping and associated cross-sections as provided by WR. The topographic mapping was obtained from the DWR Central Valley Floodplain Evaluation and Delineation Program Light Detection and Ranging Data and did not include bathymetry data.
 - Concurrences and discrepancies in the analysis results and recommendations from the existing alternatives analyses.
- Determined geotechnical alternatives analyses based on our evaluation described above.

3. PROJECT DESCRIPTION

The City of West Sacramento (City) is protected from flooding by levees surrounding the entire City; on the west by levees along the Yolo Bypass, Deep Water Ship Channel (DWSC); on the north by the Sacramento Bypass South Levee; on the north and east by the Sacramento River West North and South Levees (SRWNL and SRWSL); and on the south by the South Cross Levee. The City is also bifurcated by the Sacramento River DWSC and Barge Canal, which have levees on both sides. Figures 1 and 2a/2b present a Vicinity Map and Levee Segment Maps, respectively.

The City and West Sacramento Area Flood Control Agency (WSAFCA) are in the process of developing a baseline 200-year Flood Program (Flood Program) in order to comply with statemandated Urban Level of Flood Protection (ULOP) requirements by 2025. When completed, the Flood Program will provide the City with protection from a 200-year flood event. The first step toward developing the Flood Program is to identify the locations of levee segments that do not meet Urban Levee Design Criteria (ULDC) requirements.

This GAAR provides a summary of the BCI GPIR and presents alternatives to address the identified geotechnical levee deficiencies for the levee system surrounding West Sacramento. These geotechnical alternatives address steady-state through seepage, underseepage, and landside slope stability, and waterside rapid drawdown slope stability deficiencies.

4. RELEVANT EVALUATIONS BY OTHERS

The levees that protect the City have been studied in detail as part of several different efforts. Previous studies by Kleinfelder and HDR for the City of West Sacramento on behalf of the West Sacramento Area Flood Control Agency (WSAFCA), the United States Army Corps of Engineers (USACE), and URS for the Department of Water Resources (DWR) provide a geotechnical assessment of the existing levee system with respect to steady-state through seepage, underseepage, landside slope stability, waterside rapid drawdown slope stability. These studies identify and provide methods to address geotechnical deficiencies within the levee system.

BCI reviewed the following documents as part of the current problem identification evaluation for the City of West Sacramento Flood Program Engineering Services:

- <u>West Sacramento Levee System, Problem Identification and Alternatives Analysis,</u> <u>Volume 1 - Geotechnical Problem Identification</u> (Kleinfelder PIR/AA), Kleinfelder 2007,
- <u>Preliminary Seismic Evaluation, West Sacramento Levee Assessment, Sacramento</u> <u>River, Reach 1 (Sacramento River Right Bank Levee), Reclamation District 900, Yolo</u> <u>County, Kleinfelder 2007,</u>
- <u>West Sacramento Levee Evaluation Project</u>, Draft Problem Identification Report (HDR PIR), HDR 2008,
- <u>West Sacramento Area Flood Control Agency, Levee Improvement Program,</u> <u>Alternatives Analysis</u> (HDR AA), HDR 2009,
- <u>Phase 1 Geotechnical Data Report, West Sacramento Study Area</u> (URS P1GDR), URS 2008,
- <u>Draft Supplemental Geotechnical Data Report, West Sacramento Study Area</u> (URS SGDR), URS 2009,
- <u>Guidance Document for Geotechnical Analysis, Urban Levee Geotechnical</u> <u>Evaluations Program Report</u>, (URS Guidance Document) prepared for the State of California Department of Water Resources (DWR), 2011,

- <u>Geotechnical Evaluation Report, Volume 1, Existing Conditions, West Sacramento</u> <u>Study Area</u> (URS GER), URS 2012,
- <u>Geotechnical Evaluation Report, Volume 2, Remedial Measures, West Sacramento</u> <u>Study Area</u> (URS RM), URS 2012, prepared for DWR Urban Levee Geotechnical Evaluation (ULE) program,
- <u>Supplemental Geotechnical Data Report, South West Sacramento Study Area</u> (URS SWS SGDR), URS 2013, prepared for DWR Urban Levee Geotechnical Evaluation (ULE) program,
- <u>Geotechnical Evaluation Report, Volume 1, Existing Conditions, South West</u> <u>Sacramento Study Area</u> (URS SWS GER), URS 2014, prepared for DWR Urban Levee Geotechnical Evaluation (ULE) program,
- <u>Geotechnical Evaluation Report, Volume 2, Remedial Alternatives, South West</u> <u>Sacramento Study Area</u> (URS SWS RA), URS 2015, prepared for DWR Urban Levee Geotechnical Evaluation (ULE) program,
- Geotechnical Levee Practice, <u>REFP10L0</u>, <u>USACE</u>, 2008,
- <u>West Sacramento Project General Reevaluation Report, Geotechnical Appendix,</u> <u>October 2015</u>, (USACE GRR GA), prepared by the USACE, and
- <u>Periodic Inspection Report No. 1, West Sacramento Sac Yolo South</u> (USACE PI), 2015, prepared by HDR/Fugro, WLA for USACE.

BCI also reviewed the following design and construction documents prepared by the USACE, BCI, and HDR for West Sacramento levee improvements that have recently been completed or scheduled for construction in in the near future:

- Emergency Levee Repairs, East Yolo Bypass RD 900, As-Built, USACE 1983
- <u>West Sacramento / Mitigation Area Site Preparation, General Plan and Index of</u> <u>Drawings</u> Wahler Associates 1990,
- <u>PL84-99 Emergency Levee Repair East Levee Yolo Bypass (Various Locations) and</u> <u>Scott Creek</u> USACE 1995,
- <u>West Sacramento Project Levee Reconstruction Contract A</u>, (USACE Contract A) USACE 1998,
- <u>West Sacramento Project Levee Reconstruction Contract B</u>, (USACE Contract B) USACE 1999
- <u>West Sacramento Project Drainage Ditch and Levee Slump Repair Remaining Work</u> USACE FY 2002,
- <u>West Sacramento Project Levee Slump Repair 2</u> USACE FY 2004,
- <u>West Sacramento Project Levee Reconstruction Contract C</u>, (USACE Contract C) USACE FY 2009,
- West Sacramento Levee Improvement Program, Early Implementation Project, I Street Bridge, As-Builts, HDR 2009 (HDR I Street),

- <u>Sacramento River Bank Protection Project, Sacramento River Erosion Repair Site,</u> <u>Rivermile 57.2R, West Sacramento, CA</u> USACE 2010,
- <u>West Sacramento Project Levee Reconstruction Contract "D" North Repair Site</u>, (USACE Contract D) USACE 2011,
- <u>West Sacramento Levee Improvement Program, Early Implementation Project, The</u> <u>Rivers Phase 1 Site, As-Built, HDR 2012 (HDR The Rivers)</u>,
- West Sacramento Levee Improvement Program, Early Implementation Project, C.H.P. Academy Site - Sacramento Bypass, As-Built, HDR 2012 (HDR CHP Academy)
- <u>Draft Geotechnical Basis of Design Report, Southport Early Implementation Project</u> <u>Up to 90% Design</u>, BCI, 2015 (BCI Southport EIP).

A brief description of the main documents BCI reviewed for this current study follows.

4.1 West Sacramento Area Flood Control Agency Levee Improvement Program Alternatives Analysis Report

HDR prepared the HDR AA, with consideration to the Draft HDR PIR. The HDR AA presents findings to upgrade the West Sacramento levee system to a level that provides protection from a 200-yr flood event. The HDR AA presents the mitigation selection process, the recommended mitigation alternatives, and a graphical summary of the alternatives considered in the study to mitigate identified deficiencies.

4.2 Geotechnical Evaluation Report, Volume 2, Remedial Measures, West Sacramento Study Area

The 2012 URS RM develops conceptual remediation for the levees identified as having deficiencies in the URS GER (Volume 1). The URS RM presents the levee reaches requiring remediation, the associated deficiency, and the evaluation and confirmation of remediation. In general, URS developed two applicable remedial alternatives for a levee reach considering geomorphology, construction history, past performance data and numerical modeling. Based on practicality, URS then selected one alternative to verify by evaluations and/or analyses.

4.3 Geotechnical Evaluation Report, Volume 2, Remedial Alternatives, South West Sacramento Study Area

The 2014 URS SWS RM presents analysis, evaluation results and associated cost estimates for selecting conceptual remedial alternatives for levees not meeting ULE criteria within the South West Sacramento Study Area as identified in Volume 1, URS SWS GER. Similar to the URS RM, this URS SWS RM presents the levee reaches requiring remediation with the associated deficiency, and the evaluated and confirmed remediation. In general, URS developed two applicable remedial alternatives for a levee reach considering geomorphology, construction history, past performance data and numerical modeling. Based on practicality, URS then selected one alternative to verify by evaluations and/or analyses.

4.4 USACE West Sacramento Project, General Reevaluation Report

The USACE prepared the USACE GRR GA to the General Reevaluation Report for the West Sacramento Project. The USACE GRR GA presents findings from the USACE's geotechnical evaluation and recommendations to address levee deficiencies within the West Sacramento GRR study area. The USACE GRR GA tabulated recommendations to address the identified deficiencies, with additional consideration to existing available subsurface information for cutoff wall depth determination.

5. SUMMARY OF REMEDIAL ALTERNATIVES

The GPIR presents a summary of the levee reaches with identified deficiencies. To address each deficiency, BCI presents one or more recommended remedial alternatives. BCI provides below a general description of each of the alternatives and the deficiencies these alternatives address:

- Drained Stability Berm: designed to address steady-state through seepage and landside slope stability deficiencies.
- Shallow Cutoff Wall: designed to address steady-state through seepage and landside slope stability deficiencies and shallow, uncontrolled nuisance seepage through near-surface silty sand and poorly-graded sand with silt layers, and crevasse splay deposits.
- Deep Cutoff Wall: designed to address steady-state through seepage, underseepage and landside slope stability deficiencies.
- Seepage Berm: designed to address steady-state underseepage and landside slope stability deficiencies.
- Waterside Slope Flattening: designed to address rapid drawdown slope stability deficiencies.
- Waterside Slope Repair with Keyway: designed to address waterside slope slumping during or following high water events.
- Landside Slope Repair with Keyway: designed to address landside slope slumping during or following high water events.
- No Action, Monitor During High Water Events: designed to document landside slope conditions during high water events with respect to potential through seepage and/or landside slope slumping.
- Landside Restrictions: designed to require specific landside restrictions to address steady-state underseepage deficiencies. Restrictions include maintaining a specified water level in landside ditches or restricting landside borrow.
- Relief Wells: designed to address underseepage deficiencies. Due to the water quality permitting needs, increased operation and maintenance responsibilities, and potential impacts to pump stations and internal drainage facilities, relief wells were not identified as a preferred seepage remediation measure.

6. BCI GEOTECHNICAL PROBLEM IDENFICIATION REPORT FINDINGS

BCI prepared the GPIR as part of the overall problem identification evaluation of the West Sacramento flood control system. To prepare the GPIR, BCI reviewed existing available geotechnical evaluations, data and design reports and plans. BCI then performed geotechnical problem identification of each levee segment for steady-state though seepage, underseepage and landside slope stability and waterside rapid drawdown slope stability. Figure 3 presents BCI's identified deficiencies for each levee segment, presented as Figure 11 in the BCI GPIR.

7. GEOTECHNICAL ALTERNATIVES ANALYSIS

BCI evaluated several mitigation alternatives to address the identified deficiencies presented in the BCI GPIR. To conduct this evaluation, BCI:

- Considered mitigation alternatives provided in the USACE, URS and HDR documents, including information presented in the following:
 - Tables 13-1 through 13-10 of the July 2015 USACE GRR.
 - o Appendix B, Individual Reach Analysis, contained in the 2012 URS RM,
 - Appendix B, Remediated Conditions Analyses and Cost Estimates, contained in the 2015 URS SWS RA,
 - Figures 13 through 35 of the 2009 HDR AA 2009,
- Considered the specific subsurface conditions within each levee stretch as provided in the USACE, URS and HDR documents,
- Considered relevant information contained in the evaluations performed by others as well as design and construction documents prepared by the USACE, BCI and HDR, all of which are referenced in Section 4.0, and
- Considered topographic surveys and associated cross-sections within each levee segment as provided by WR.

Tables 1 through 9 include BCI's identified geotechnical deficiencies and the respective alternatives to address these deficiencies. Where applicable, BCI presents several alternatives to address a deficiency. Most of the recommendations require confirmation with additional geotechnical subsurface explorations and/or geotechnical seepage and stability evaluations.

Tables 1 through 9 also present the USACE, URS, and HDR identified geotechnical deficiencies and the respective mitigation recommendations presented in each report.

The following sections contain a brief description of the subsurface conditions, identified geotechnical deficiencies, recent improvements, and mitigation recommendations for each levee segment. BCI determined these alternatives based on available explorations and evaluations. Additional geotechnical explorations and evaluations may either reduce or possibly eliminate some of these alternatives.

7.1 Sacramento River West North Levee (SRWNL)

The SRWNL extends for approximately 5.8 miles along the west bank of the Sacramento River from the Sacramento Bypass South Levee to the Port North Levee (i.e. Barge Canal). The levee embankment consists predominantly of poorly-graded sand to poorly-graded sand with silt. The near-surface layer immediately underlying the levee and extending landside and waterside (commonly referred to as the "blanket") consists of silt and clay and varies in thickness from 8 feet to 40 feet, with interbedded layers of silty sand. The relatively permeable soil underlying the blanket (the "aquifer") generally consists of pervious poorly-graded sand with silt and poorly-graded gravel.

Many stretches of levee within this segment are considered high ground and/or wide levees. BCI developed the alternatives considering the existing landside topography and assumed that any landside development would require analysis to determine potential detrimental impacts to the levee, and future development.

BCI and others have generally identified steady-state through seepage deficiencies throughout this levee segment, with isolated areas of steady-state underseepage and landside slope stability deficiencies and waterside rapid drawdown slope stability deficiencies. As discussed in the BCI GPIR, two areas have recently been improved as part of two Early Implementation Projects; "The Rivers EIP" project extending from Station 71+50 to Station 101+00 and "I Street Bridge EIP" project extending from Station 199+60.

BCI presents three alternatives to address steady-state through seepage deficiencies, where present, in this levee segment. Alternative 1 consists of no action with monitoring during high water events; this may result in future maintenance if landside slope slumping occurs during or following high water events. Alternative 2, a shallow cutoff wall to Elev. 0 feet, or Alternative 3, a drained stability berm along the landside levee slope, would mitigate the steady-state through seepage deficiency.

Two alternatives are presented to address steady-state underseepage and landside slope stability deficiencies, where present, in this levee segment. Alternative 1 consists of a deep cutoff wall with termination depths ranging from Elev. -55 feet to Elev. -85 feet. The cutoff wall will be designed to cut off the pervious sand and gravel aquifer underlying the levee and loaded by the Sacramento River. Additional explorations will be required to confirm the cutoff wall depth. Alternative 2 consists of a 100- to 150-foot-wide seepage berm, which is wider than a calculated minimum berm width. BCI anticipate that the wider berm will be required due to the thick aquifer and the proximity of the Sacramento River to the levee. Additional analyses will be required to confirm the required seepage berm width.

Waterside slopes steeper than 2H:1V exist within several stretches of this levee segment. For levee stretches considered high ground and/or wide levees, identification of a waterside rapid drawdown slope stability deficiency is dependent on the assumed embedded levee template. Two alternatives are considered within these levee stretches with waterside slopes steeper than 2H:1V. The first alternative consists of flattening the waterside slopes to 2H:1V. The second

alternative considers this a maintenance issue, which requires waterside slope repair, as necessary, to maintain the identified levee template waterside slope.

In multiple areas, BCI recommends additional explorations and geotechnical analyses to confirm the identified deficiencies. These explorations and analyses may reduce or eliminate the need for remediation in isolated levee stretches.

Table 1 presents a summary of our recommended alternatives.

7.2 Sacramento River West South Levee (SRWSL)

The SRWSL extends for approximately 6.3 miles along the west bank of the Sacramento River from the Port South Levee (i.e. Barge Canal) to the South Cross Levee. The levee embankment consists predominantly of poorly-graded sand to poorly-graded sand with silt. The blanket consists of silt and clay and varies in thickness from 8 feet to 40 feet, with interbedded layers of silty sand. The aquifer generally consists of pervious poorly-graded sand with silt and poorly-graded gravel.

Previous studies identified geotechnical deficiencies throughout this levee segment; however, the USACE performed recent levee improvements in the northern section of the levee segment and the Southport EIP project will address identified deficiencies for the remaining levee segment. No additional analyses will be required for this levee segment as part of this current study due to these improvements. Table 2 presents a summary of our recommended alternatives.

7.3 Sacramento Bypass South Levee & Training Berm

The Sacramento Bypass South Levee extends for approximately 1.2 miles along the south side of the Sacramento Bypass between the Sacramento River to the Yolo Bypass East Levee. The Training Berm is the segment of the Sacramento Bypass South Levee that extends approximately 0.5 miles past the Yolo Bypass East Levee into the Yolo Bypass. The Training Berm directs water from the Sacramento Bypass into the main channel of the Yolo Bypass. Properties in the City do not directly depend on the Training Berm for flood protection.

Recent levee improvements occurred along the Sacramento Bypass South Levee from Station 0+00 to Station 61+75 to address identified geotechnical deficiencies. These improvements were constructed under the West Sacramento Project Levee Reconstruction Contract B under USACE, and the CHP Academy EIP under the West Sacramento Levee Improvement Program (WSLIP) and included slope flattening, levee raises, and slurry cutoff walls.

The levee embankment along the entirety of the Training Berm consists predominantly of silt and clay. The westernmost portion of the Sacramento Bypass South Levee (from Station 0+00 to approximate Station 35+00) also consists predominantly of silt and clay. East of Station 35+00, the original material levee embankment transitions to sand to silty sand. The CHP Academy EIP as-builts indicate that the levee improvement reconstructed cap consists of Type 1 levee material. Type 1 levee material is defined as lean clay, silt or clayey silt in the Final Design Documentation Report prepared by HDR. The blanket consists of silt and clay and varies in thickness from 10 to 50 feet, with interbedded layers of silty sand. The aquifer generally consists of pervious poorly-graded sand with silt and poorly-graded gravel.

With consideration of the levee improvements recently performed on the Sacramento Bypass Levee, BCI presents two alternatives from Station 61+75 to Station 64+99 (the east end of the levee segment) to address steady-state through seepage and underseepage deficiencies. Alternative 1 consists of waterside slope flattening and a deep cutoff wall with a termination depth of Elev. -100 feet. The cutoff wall will be designed to cut off the pervious sand and gravel aquifer underlying the levee which may be loaded by the Sacramento River. Additional explorations will be required to confirm the cutoff wall depth and potential influence of the Sacramento River. Alternative 2 consists of waterside slope flattening and a minimum 100-footwide seepage berm. Additional analysis will be required to confirm the design width. Additional geotechnical analyses may reduce the alternative to a shallow cutoff wall with a termination depth to Elev. -5 feet.

Although BCI does not recommend any alternatives from Station 40+00 to Station 61+75, we do recommend evaluating piezometer readings and visual inspections during high water events to confirm that the recent levee improvements are performing as designed. In addition, BCI agrees with previous studies to flatten the slopes of the Training Berm to 3H:1V to address slope stability deficiencies.

Table 3 presents a summary of our recommended alternatives.

7.4 Yolo Bypass East Levee

The Yolo Bypass East Levee extends for approximately 3.7 miles along the east side of the Yolo Bypass from the Sacramento Bypass South Levee to the Port North / DWSC West Levees. The levee embankment consists predominantly of lean and fat clay and loose silt. The blanket consists of silt and clay and varies in thickness from 5 to 20 feet, with some areas of interbedded layers of silty sand. The aquifer generally consists of pervious poorly-graded sand with silt, poorly-graded sand and silty sand of varying thickness.

BCI and others have identified steady-state through seepage, underseepage, landside slope stability and waterside rapid drawdown slope stability deficiencies generally throughout the levee segment. The USACE has performed numerous reconstruction projects throughout this levee segment, several as emergency repairs to levee slope failures on both the waterside and landside slopes. Up to eight different plan sets document repairs conducted along this levee stretch.

BCI and others identified steady-state underseepage and landside slope stability deficiencies from Station 25+00 to Station 51+63. To address these deficiencies, BCI presents two alternatives. Alternative 1 includes a deep cutoff wall to Elev. -10 feet, with additional explorations required to confirm the cutoff layer. Alternative 2 includes a minimum 80-footwide seepage berm with additional analyses required to confirm the berm width.

From Station 51+63 to Station 70+00 and from Station 82+82 to Station 136+00, BCI recommends alternatives consisting of landside and/or waterside slope mitigation measures with a reinforced levee toe and keyway for those areas that have not been improved during recent levee repairs. BCI recommends additional trench explorations to confirm the existing subsurface soil conditions.

From Station 136+00 to Station 155+00, BCI recommends two alternatives to address steadystate underseepage deficiencies. Alternative 1 includes a deep cutoff wall to Elev. -55 feet with additional explorations needed to confirm the cutoff layer. Alternative 2 includes a minimum 80-foot-wide seepage berm with additional evaluations to confirm the berm width. Additional explorations and analyses may reduce the alternatives analyses to no mitigation in this area.

Beyond Station 155+00, the recent mitigation measures implemented by the USACE should be sufficient. Table 4 presents a summary of our recommended alternatives.

7.5 Deep Water Ship Channel West Levee (DWSC WL)

The DWSC West Levee (a.k.a. Navigation Levee) extends for approximately 19 miles along the west bank of the DWSC from the Yolo Bypass East Levee/Port North Levee to Miner Slough. The levee embankment consists predominantly of lean to fat clay with lenses of silty sand and clayey sand. The blanket consists of silt and clay and varies in thickness from 5 to 25 feet with lenses of silty sand and clayey sand. The aquifer generally consists of silty sand and pervious poorly-graded sand with silt, poorly-graded sand, poorly-graded gravel and poorly-graded gravel with silt of varying thickness. At the downstream end of the segment, the aquifer consists of thin lenses of silty sand and poorly-graded sand with silt.

Previous studies identified steady-state through seepage, underseepage, and landside slope stability deficiencies in some reaches along this levee. However, these analyses considered cross-sections based on limited subsurface explorations and some assumed future landside borrow, which impacts seepage and landside stability.

We recommend two primary alternatives along this levee. The first is no mitigation, with the requirement of channel-side borrow restrictions. Currently, the spoils of dredged material from the channel, which have been placed on the ship channel side of the levee, act as a seepage and stability berm. If removal of the spoils is restricted, seepage and stability deficiencies are prevented. Further geotechnical evaluation will be required to determine the required boundaries for removal. Our second primary alternative is a deep cutoff wall with varying termination elevations based on the anticipated depth to a cutoff layer. In most cases, the deep cutoff wall would eliminate the need for borrow restrictions beyond the levee template. In two stretches, Station 202+00 to 209+00 and 681+00 to 705+00, BCI provides additional alternatives to address the sandy material noted within the levee.

Table 5 presents a summary of our recommended alternatives.

7.6 Deep Water Ship Channel East Levee (DWSC EL)

The evaluated portion of the DWSC East Levee extends for approximately 2.6 miles south along the east side of the DWSC from the Port South Levee to the South Cross Levee. The levee embankment consists predominantly of lean and fat clay. The blanket consists of silt and clay and varies in thickness from 10 to 20 feet with lenses of silty sand. The aquifer generally consists of silty sand and pervious poorly-graded sand with silt and poorly-graded sand of varying thickness up to Station 91+00. Beyond Station 91+00, the aquifer consists of thin lenses of silty sand and poorly-graded sand with silt.

Previous studies identified steady-state through seepage, underseepage, and landside slope stability, and waterside rapid drawdown deficiencies in this levee segment. However, these analyses considered cross-sections based on limited subsurface explorations. In addition, the underseepage deficiency is identified at the landside ditch, not at the levee toe.

BCI presents two alternatives to address these deficiencies. Alternative 1 consists of a deep cutoff wall of varying depths. Additional explorations will be required to confirm the cutoff layer. Alternative 2 consists of an 80-foot-wide seepage berm. Additional geotechnical evaluations will be required to confirm the seepage berm width. In addition, BCI recommends waterside slope flattening near both pump stations, and landside slope flattening near the Main Drain Pump Station.

Additional explorations and evaluations may reduce these alternatives. Table 6 presents a summary of our recommended alternatives.

7.7 South Cross Levee

The South Cross Levee extends for approximately 1.2 miles between the SRWSL and the DWSC East Levee. The levee embankment consists predominantly of lean and fat clay. The blanket consists of silt and clay and varies in thickness from 15 to 40 feet. The aquifer generally consists of silty sand and pervious poorly-graded sand with silt and poorly-graded sand of varying thickness.

BCI and others identified steady-state underseepage and landside slope stability, and waterside rapid drawdown slope stability deficiencies generally throughout this levee segment. BCI presents two alternatives to address these deficiencies. Alternative 1 consists of landside slope flattening and a cutoff wall to Elevation -35 feet. Additional explorations will be required to confirm the cutoff layer. Alternative 2 consists of a minimum 80-foot-wide seepage berm. Additional analyses will be required to confirm the berm width.

The analyses performed by others assumed connectivity between the existing waterside borrow trench and landside aquifer, which may be overly conservative. Therefore, additional explorations and evaluations may reduce the recommended alternatives to either no mitigation or only landside slope flattening. Table 7 presents a summary of our recommended alternatives.

7.8 Port North Levee

The Port North Levee extends for approximately 4.6 miles along the north bank of the DWSC between the Yolo Bypass East Levee / DWSC West Levee and the SRWNL/Barge Canal. There are many structures along the levee associated with the Port of West Sacramento. This includes the lock structure associated with the Barge Canal at the eastern end. In general, the Port North Levee serves as high ground for industrial development. Due to the nature of the Port of West Sacramento, there are many low points in the Port North Levee that are used to access the water. The levee embankment consists predominantly of lean and fat clay. The blanket consists of silt and clay and varies in thickness from 10 to 20 feet. The aquifer generally consists of silty sand and pervious poorly-graded sand with silt and poorly-graded sand of varying thickness.

Previous studies did not identify any geotechnical deficiencies in this levee segment. However, the existing number of explorations does not meet USACE criteria, the levee is partially deficient in freeboard, and one over-steep stretch has not been previously evaluated for rapid drawdown risk.

From Stations 8+00 to 26+00 and 35+50 to 236+00, two alternatives are presented. Alternative 1 is no mitigation with potential nuisance (shallow foundation) seepage and resulting landside maintenance concerns, and Alternative 2 is a shallow cutoff wall, which would prevent any nuisance seepage.

From Station 26+00 to 35+50, waterside slope flattening is recommended, as the steep slope presents a rapid drawdown concern. However, additional explorations and a geotechnical evaluation may eliminate the need for this mitigation.

Table 8 presents a summary of our recommended alternatives.

7.9 **Port South Levee**

The Port South Levee extends for approximately 3.7 miles along the southern bank of the DWSC between the DWSC East Levee and the Sacramento River/Barge Canal. The levee embankment consists predominantly of lean and fat clay, with some sand on the eastern leg of the levee. The blanket consists of silt and clay and varies in thickness from 10 to 40 feet. The aquifer generally consists of silty sand and pervious poorly-graded sand with silt and poorly-graded sand of varying thickness.

Previous studies identified a steady-state underseepage deficiency in one portion of this levee. In addition to this deficiency, BCI identified an area of waterside rapid drawdown slope stability risk, and an area subject to through seepage and nuisance seepage.

From Stations 23+00 to 116+00 and 118+00 to 123+50, we present two alternatives to address underseepage. Alternative 1 is a deep cutoff wall, and Alternative 2 is a 45- to 50-foot-wide seepage berm. From Station 138+00 to 158+00, we recommend waterside slope flattening to mitigate rapid drawdown slope instability. Partially overlapping this segment, from Station 143+00 to 186+93, we recommend consideration of a shallow cutoff wall to mitigate through

seepage and potential nuisance seepage. Since existing explorations and geotechnical evaluations along this levee are limited, it is possible that any of these alternatives may be determined to be unnecessary with further explorations and subsequent evaluations.

Table 9 presents a summary of our recommended alternatives.

8. LIMITATIONS

BCI prepared this GAA for Wood Rogers and the West Sacramento Area Flood Control Agency for the West Sacramento Flood Engineering Services Problem Identification Report. This GAA should not be used by others or for other projects without BCI's written permission.

This study was limited to the evaluation of work performed by others. Additional subsurface exploration, laboratory testing, and analysis recommended in this report will be necessary to provide a sufficient evaluation of geotechnical deficiencies in some levee segments.

BCI performed services in accordance with generally accepted geotechnical engineering principles and practices currently used in this area. We do not warranty our services.

Our scope did not include evaluation of on-site hazardous material or biological pollutants. Please contact BCI if you would like an evaluation of these items.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Mitigation<br>Environmental
